C24 interactive

C24 Interactive Gateway
C24-Touch
C24-Hub

Features That Make a Difference:

- Hub of C24 Interactive system gives customers the ability to remotely monitor and control their security system – and minimize nuisance calls

- Private Wi-Fi network to connect C24 Interactive Camera(s) and C24 Touchscreen(s)

- Easy 4-wire connection to the RS-422 interface module (IT-230, GS2060-SM)

- Integration with wireless Z-Wave® devices including thermostats, lighting and locks to create a fully automated controlled 'smart home'

- Quick easy installation and device enrollment through 'wizards' saves time

- Easily upgradeable for additional packages and devices such as additional Z-Wave® modules

- Less installation disruption for your customers that lets you move on to the next job quickly

Ultimate Control with the C24 Interactive Gateway

C24 Interactive Gateway is the hub of the C24 Interactive system, interfacing with other connected devices on the system. With the integrated private Wi-Fi network, the C24 Interactive Gateway securely connects to Wi-Fi C24-compatible devices such as the C24 Touchscreen, C24 Interactive Cameras and Z-Wave® enabled products used for home automation. By connecting to a security panel and router, customers can administer their security system and receive instant status updates from a computer, mobile web-browser or native mobile app. Whether home or away, at the desk or on the go, C24 Interactive has a solution that works for your customers now, and in the future.

User-Friendly Control and Connection

C24 Interactive – supported by the C24 Interactive Gateway – has multiple ways for your customers to monitor and control their security system to meet their lifestyle needs. Customers have the option of using the secure, password-protected and easy-to-use C24 Portal on computers, C24 Manager Mobile App for Apple® and Android™ devices and C24 Mobile Portal for Blackberry® and other smartphone devices. The C24 Manager Orb - included with all connection methods - displays instant status updates of a customer's security system and gives them the option to potentially resolve nuisance calls before escalation.

Uncompromised Security

The C24 Interactive Gateway delivers the security features and ease-of-access that your customers expect and demand. The 4-wire connection to the RS-422 interface module links to either the DSC IT-230 or DSC GS2060-SM (PowerSeries). This provides control of the security panel through the user-friendly security interfaces: C24 Manager, C24 Touchscreen and mobile devices.

The C24 Interactive Gateway allows users to remotely or on-site:
- Arm in multiple modes (stay/away)
- Disarm the system
- Bypass zones
- Check event history
- Control lights, temperature and locks

Ultimate Automation

With the integrated Z-Wave® host controller, the C24 Interactive Gateway allows homeowners to have Z-Wave® enabled thermostats, lighting and locks monitored and controlled wirelessly through the C24 Manager, C24 Touchscreen and mobile devices. With Z-Wave® Technology, any home can quickly and easily become a 'smart home'.

Z-Wave® thermostats permit remote control of temperature in the home with extremely flexible scheduling and customized event triggers. Through the C24 Portal, up to 100 different 'scenarios' can be configured for your customer's convenience. Event triggers (arming/disarming) can be used to control thermostat settings and save on energy costs. For example, arming the system in the morning to 'away' could turn the thermostat down in the winter (or up in the summer). Then at a pre-determined time or when disarmed, the thermostat could return to another

temperature. Additional options can display temperature history and other variables to help save energy.

Z-Wave® in-wall light switches and plug-in lamp modules give customers the ability to control and monitor what lights or appliances are on or off. As with the Z-Wave® enabled thermostat, customers can also add Z-Wave® lighting modules to event triggers to not only save on energy costs but also to enhance security visibility.

Similarly, customers can control and monitor Z-Wave® dead-bolt lock modules and add them as an event trigger when developing 'scenarios'.
