WARNING

This manual contains information on limitations regarding product use and function and information on the limitations as to liability of the manufacturer. The entire manual should be carefully read.

Installation Manual
WARNING Please Read Carefully

Note to Installers
This warning contains vital information. As the only individual in contact with system users, it is your responsibility to bring each item in this warning to the attention of the users of this system.

System Failures
This system has been carefully designed to be as effective as possible. There are circumstances, however, involving fire, burglary, or other types of emergencies where it may not provide protection. Any alarm system of any type may be compromised deliberately or may fail to operate as expected for a variety of reasons. Some but not all of these reasons may be:

- **Inadequate Installation**
  - A security system must be installed properly in order to provide adequate protection. Every installation should be evaluated by a security professional to ensure that all access points and areas are covered. Locks and latches on windows and doors must be secure and operate as intended. Windows, doors, walls, ceilings and other building materials must be of sufficient strength and construction to provide the level of protection expected. A reevaluation must be done during and after any construction activity. An evaluation by the fire and/or police department is highly recommended.
- **Criminal Knowledge**
  - This system contains security features which were known to be effective at the time of manufacture. It is possible for persons with criminal intent to develop techniques which reduce the effectiveness of these features. It is important that a security system be reviewed periodically to ensure that its features remain effective and that if it is updated or replaced if it is found that it does not provide the protection expected.
- **Access by Intruders**
  - Intruders may enter through an unattended access point, circumvent a sensing device, evade detection by moving through an area of insufficient coverage, disconnect a warning device, or interfere with or prevent the proper operation of the system.
- **Power Failure**
  - Control units, intrusion detectors, smoke detectors and many other security devices require an adequate power supply for proper operation. If a device operates only by AC power, any interruption, however brief, will render that device inoperative while it does not have power. Power interruptions of any length are often accompanied by voltage fluctuations which may damage electronic equipment such as a security system. After a power interruption has occurred, immediately complete a complete system test to ensure that the system operates as intended.
- **Failure of Replaceable Batteries**
  - This system’s wireless transmitters have been designed to provide several years of battery life under normal conditions. The exception is the battery life of the power supply unit. Replacement of power supply units is recommended as necessary. Batteries are not replaceable. If the batteries fail. Even if the batteries have not failed, they must be charged, in good condition and installed correctly. If a device operates only by DC power, any interruption, however brief, will render that device inoperative. The system contains back-up batteries to prevent any loss of security caused by power failure. If the back-up batteries are not charged, the system will not operate as expected. The replacement of any battery must be done by qualified personnel. Preventive maintenance will keep the system in good operating condition.
- **Compromise of Radio Frequency (Wireless) Devices**
  - Signals may not reach the receiver in all circumstances which could include metal objects placed on or near the radio path or deliberate jamming or other inadvertent radio signal interference.
- **System Users**
  - It is important that a security system be reviewed periodically to ensure that its features remain effective and that if it is updated or replaced if it is found that it does not provide the protection expected.
- **Motion Detectors**
  - Smoke detectors that are a part of this system may not properly alert occupants of a fire for a number of reasons, some of which include:
    - The smoke detector is located in the wrong place. The smoke detectors may have been improperly installed or positioned. Smoke detectors may not be able to reach the sensing devices, such as when the fire is in a chimney, wall, or ceiling. Smoke detectors may not detect smoke from fires on another level of the building.
    - Every fire is different in the amount of smoke produced and the rate of burning. Smoke detectors cannot detect smoke that is present in unobstructed areas covered by these beams. They cannot detect moving which occurs behind walls, ceilings, floors, closed glass doors or windows. Any type of tampering whether intentional or unintentional such as masking, painting, or spraying of any material on the lenses, mirrors, windows or any other part of the detection system will impair its proper operation.
    - Passive infrared motion detectors operate by sensing changes in temperature. However their effectiveness can be reduced when the ambient temperature rises near or above body temperature or if there are intentional or unintentional sources of heat in or near the detection area. Some of these heat sources could be heaters, radiators, ovens, barbecues, fireplaces, sunlight, steam vents, lighting and so on.
- **Warning Devices**
  - Warning devices such as sirens, bells, horns, or strobes may not warn people or awaken someone sleeping if there is an intervening wall or door. If warning devices are located on a different level of the residence or premise, then it is less likely that the occupants will be alerted or awakened. Audible warning devices may be interfered with by other noise sources such as stereo, radio, television, air conditioners or other appliances, and passing traffic. Audible warning devices, however loud, may not be heard by a hearing-impaired person.
- **Telephone Lines**
  - If some or all of the lines are used to transmit alarms, they may be out of service or busy for certain periods of time. An installer may cut the telephone line or defeat its operation by more sophisticated means which may be difficult to detect.
- **Insufficient Time**
  - There may be circumstances when the system will operate as intended, yet the occupants will not be protected from the emergency due to their inability to respond to the warnings in a timely manner. If the system is monitored, the response may not occur in time to protect the occupants or their belongings.
- **Component Failure**
  - Although every effort has been made to make this system as reliable as possible, the system may fail to function as intended due to the failure of a component.
- **Inadequate Testing**
  - Most problems that would prevent an alarm system from operating as intended can be found by regular testing and maintenance. The complete system should be tested weekly and immediately after a break-in, an attempted break-in, a fire, a storm, an earthquake, an accident, or any kind of construction activity inside or outside the premises. The testing should include all sensing devices, keypads, consoles, alarm indicating devices and any other operational devices that are part of the system.
- **Security and Insurance**
  - Regardless of its capabilities, an alarm system is not a substitute for property or life insurance. An alarm system also is not a substitute for property owners, renters, or other occupants to act prudently to prevent or minimize the harmful effects of an emergency situation.

Limited Warranty
Digital Security Controls Ltd. warrants the original purchaser that for a period of twelve months from the date of purchase, the product shall be free of defects in materials and workmanship under normal use. During the warranty period, Digital Security Controls Ltd. shall, at its option, repair or replace any defective product, and return it to the purchaser at no charge for labor and materials. Any replacement and/or repaired parts are warranted for the remainder of the original warranty or ninety (90) days, whichever is longer. The original owner must promptly notify Digital Security Controls Ltd. in writing that there is defect in material or workmanship, such written notice to be received in all events prior to expiration of the warranty period.

International Warranty
The warranty for international customers is the same as for any customer within Canada and the United States, with the exception that Digital Security Controls Ltd. shall not be responsible for any customs fees, taxes, or VAT that may be due.

Warranty Procedure
To obtain service during this warranty, please return the item(s) in question to the point of purchase. All authorized distributors and dealers have a warranty program. Anyone returning goods to Digital Security Controls Ltd. must first obtain an authorization number. Digital Security Controls Ltd. will not accept any shipment whatsoever for which prior authorization has not been obtained.

Conditions to Void Warranty
This warranty applies only to defects in parts and workmanship relating to normal use. It does not cover:

- damage incurred in shipping or handling.
- damage caused by disaster such as fire, flood, wind, earthquake or lightning.
- damage due to causes beyond the control of Digital Security Controls Ltd. such as excessive voltage, mechanical shock or water damage.
- damage caused by unauthorized attachment, alterations, modifications or foreign objects.
- damage caused by peripherals (such as unless peripherals were supplied by Digital Security Controls Ltd.).
- defects caused by failure to provide a suitable installation environment for the products.
- damage caused by the use of the products for purposes other than those for which it was designed.
- damage from improper maintenance.
- damage arising out of any other abuse, mishandling or improper application of the products.

Digital Security Controls Ltd. is liable for damage to the equipment it manufactures only if it can be proven that the damage resulted from a defect in materials or workmanship. Digital Security Controls Ltd. neither assumes nor authorizes any other person purporting to act on its behalf to modify or to change this warranty, nor to assume for it any other warranty or liability concerning this product.

This disclaimer of warranties and limited warranty are governed by the laws of the province of Ontario, Canada.

WARNING: Digital Security Controls Ltd. recommends that the entire system be completely tested on a regular basis. However, despite frequent testing, and due to, but not limited to, criminal tampering or electrical disruption, it is possible for this product to fail to perform as expected.

Installer’s Lockout
Any products returned to DSC which have the Installer’s Lockout option enabled and exhibit no other problems will be subject to a service charge.

Out of Warranty Repairs
Digital Security Controls Ltd. will at option repair or replace out-of-warranty products which are returned to its factory according to the following conditions. Anyone returning goods to Digital Security Controls Ltd. must first obtain an authorization number. Digital Security Controls Ltd. will not accept any shipment whatsoever for which prior authorization has not been obtained.

Products which Digital Security Controls Ltd. determines to be repairable will be repaired and returned. A set fee which Digital Security Controls Ltd. has predetermined and which may be revised from time to time, will be charged for each unit repaired.

Products which Digital Security Controls Ltd. determines not to be repairable will be replaced by the nearest replacement unit available at that time. The current market price of the replacement product will be charged for each replacement unit.

Disclaimer of Warranties
This warranty contains the entire warranty and shall be in lieu of any and all other warranties, whether expressed or implied (including all implied warranties of merchantability or fitness for a particular purpose) And of all other obligations or liabilities on the part of Digital Security Controls Ltd. Digital Security Controls Ltd. neither assumes nor authorizes any other person purporting to act on its behalf to modify or to change this warranty, nor to assume for it any other warranty or liability concerning this product.

This disclaimer of warranties and limited warranty are governed by the laws of the province of Ontario, Canada.

## Section 6: Programming Worksheets  28

### Appendix A: Reporting Codes  42

### Appendix B: Programming LCD Keypads  44
PC585 Wiring Diagram

WARNING
High voltage, Disconnect AC power and telephone lines prior to servicing.

Battery capacity for standby is at least 24 hours. Example: DSC model BR712.

NOTE: Residential only, burglary installations 4Ah minimum.

16.5VAC 40VA, 80VA or 120VA: Do not connect transformer to receptacle controlled by a switch.

PGM CONNECTIONS

LED INDICATOR

RELAY OUTPUT

DSC RM-1C

Important: A minimum of separation must be maintained between RM-1C circuits and all other wiring.

TYPICAL ZONE CIRCUITS

END OF LINE RESISTORS: 5600Ω

Zone Doubling

4-WIRE SMOKE DETECTORS

Smoke Detector must be listed type (DSC Model MINI-48). The PGM Output must be programmed for sensor reset (Section 202).

RESISTOR IDENTIFICATIONS

BELL CIRCUIT

SINGLE AND DOUBLE ENDS

This device complies with Parts 15 and 68 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

FGD Reg. No.: F33CAN-33294-AL-E REN = 0.68 Plug Type: RJ-31X

INDUSTRY CANADA: REN = 0.1

MADE IN CANADA

WARNING: Not to be removed by anyone except occupant.
Section 1: System Introduction

1.1 Specifications

**Downloading Software Support**
- PC585 v2.1DJRU uses DLS-1 v6.6P and up.

**Flexible Zone Configuration**
- Four fully programmable zones; system expandable to eight zones using keypad zone inputs and wireless zones
- 38 access codes: one master code, one maintenance code, two duress codes, two supervision codes and 32 general access codes
- 29 zone types; 8 programmable zone attributes
- Normally closed, single EOL and double EOL zone wiring
- Eight wireless zones available using the PC5132 Wireless Receiver

**Audible Alarm Output**
- 700mA Supervised Bell Output (current limited at 3 amps), 12Vdc
- Steady or Pulsed Output

**EEPROM Memory**
- Does not lose programming or system status on complete AC and Battery failure

**Programmable Outputs**
- Two programmable voltage outputs; 19 programmable options
  - PGM1 = 300mA; PGM2 = 50mA

**Powerful 1.5 Amp Regulated Power Supply**
- 550 mA Auxiliary Supply, 12 Vdc
- Positive Temperature Coefficient (PTC) components replace fuses
- Supervision for loss of AC power, low battery

**Power Requirements**
- Transformer = 16.5 VAc, 40VA
- Battery = 12 volt 4 Ah minimum rechargeable sealed lead acid battery

**Remote Keypad Specifications**
- Three keypads available:
  - PC1555RKZ eight zone LED keypad with zone input
  - PC5508Z eight zone LED keypad with zone input
  - LCD5500Z Alphanumeric keypad with zone input
- All keypads have five programmable function keys
- Connect up to eight keypads
- 4-wire (Quad) connection to Keybus
- Built in piezoelectric buzzer

**Digital Communicator Specifications**
- Supports major communication formats including SIA and Contact ID
- Event-initiated personal paging
- Three programmable telephone numbers
- Two account numbers
- Supports LINKS1000 cellular communication
- Supports LINKS2X50 Long Range Radio Transmitter
- DTMF and pulse dialing
- DPDT line seizure
- Split reporting of selected transmissions to each telephone number

**System Supervision Features**
The PC585 continuously monitors a number of possible trouble conditions including:
- AC power failure
- Fault by zone
- Tamper by zone
- Fire trouble
- Failure to communicate
- Low battery by device (wireless)
- Module fault (supervisory or tamper)

**False Alarm Prevention Features**
- Audible Exit Delay
- Audible Exit Fault
- Communication Delay
- Urgency on Entry Delay

**Additional Features**
- Auto Arm at specified time
- Keypad-activated alarm output and communicator test
- All modules connect to the system via a four wire Keybus up to 1000'/305m from main panel
- An event buffer which records the past 128 events with both the time and date at which they occurred; buffer can be printed using PC5400 serial interface module, or viewed with the LCD5500Z keypad.
- Supports the addition of the PC5132 wireless receiver for integration of wireless devices
- Uploading and downloading capability
- Local downloading capability through the use of the PC-LINK adaptor
- Added Keybus fault protection: clock and data outputs have been programmed to withstand shorts to +12v to prevent control panel damage
1.2 Additional Devices
In addition to the information below, see the back cover for a DSC module compatibility table.

**PC5132 Wireless Receiver**
The PC5132 Wireless Receiver can be used to connect up to 8 wireless devices to the system. All devices are spread spectrum, 900 MHz, fully supervised devices which use standard 'AAA' or 'AA' alkaline batteries.

Seven devices are available. They are as follows:

- **WLS904 Wireless Motion Detector**
- **WLS905 Wireless Universal Transmitter**
  Adds wireless door or window contacts to your system.
- **WLS906 Wireless Smoke Detector**
- **WLS907 Wireless Slimline Universal Transmitter**
  A smaller wireless door or window contact.
- **WLS908 Wireless Panic Pendant**
  Adds personal protection to the system. When used, the unit will indicate a non-medical emergency to the central station.
- **WLS909 Wireless Key**
  Adds a simple and mobile method of arming and disarming to the system, as well as one-button access to several programmable functions.
- **WLS910 Wireless Handheld Keypad**

**PC5400 Printer Module**
The PC5400 Printer Module allows the panel to print out all events that occur on the system to any serial printer. The printout will contain the time, date and the event that occurred.

**LINKS 1000 Cellular Communicator**
The LINKS 1000 Cellular Communicator can be used three different ways: as the sole communicator for the panel, as a backup for either or both telephone numbers or as a redundant backup to the land line communicator where the panel will call both the land line and via the LINKS.

**LINKS2X50**
Either the LINKS2150 or LINKS2450 may be used to transmit alarm information over a long range radio network.

**Cabinets**
Several different cabinets are available for the PC585 modules. They are as follows:

- **PC5003C Cabinet**
  Main control cabinet for the PC585 main panel. Dimensions 288mm x 298mm x 78mm / 11.3“ x 11.7“ x 3“ approximately.

- **PC5004C Cabinet**
  Cabinet to house the PC5400 Printer Module. Dimensions 229mm x 178mm x 65mm / 9“ x 7“ x 2.6“ approximately.

1.3 Out of the Box
Please verify that the following components are included in your system:
- one PC5003C main control cabinet
- one PC585 main control circuit board
- one PC1555RKZ keypad with zone input
- one Installation Manual with programming worksheets
- one Instruction Manual for the end user
- one hardware pack consisting of:
  - one mylar cabinet label
  - four plastic circuit board standoffs
  - eight 5600Ω (5.6K) resistors
  - one 2200Ω (2.2K) resistor
  - one 1000Ω (1K) resistor
  - ground connection assembly
  - one cabinet door plug
Section 2: Getting Started

The following sections provide a thorough description of how to wire and configure devices and zones.

2.1 Installation Steps

Read this section completely before you begin. Once you have an overall understanding of the installation process, carefully work through each step.

Step 1: Create a Layout

Draw a rough sketch of the building to get an idea of where all alarm detection devices, keypads and other modules are to be located.

Step 2: Mounting the Panel

Mount the panel in a dry area close to an unswitched AC power source and the incoming telephone line. Before attaching the cabinet to the wall, be sure to press the four circuit-board mounting studs into the cabinet from the back. After you have attached the cabinet to the wall, stick the provided DSC logo sticker on the front of the cabinet.

NOTE: You must complete all wiring before connecting the battery, or applying AC to the panel.

Step 3: Wiring the Keybus (Section 2.3)

Wire the Keybus to each of the modules following the guidelines provided in section 2.3 of this manual.

Step 4: Zone Wiring (Section 2.8)

You must power down the control panel to complete all zone wiring. Please refer to section 2.8 “Zone Wiring” on page 5 when connecting zones using normally closed loops, single EOL resistors, double EOL resistors, Fire zones and Key-switch Arming zones.

Step 5: Complete Wiring (Section 2.2)

Complete all other wiring including bells or sirens, telephone line connections, and ground connections following the guidelines provided in section 2.2.

Step 6: Power up the Control

Once all zone and Keybus wiring is complete, power up the control panel. First, connect the red battery lead to the positive battery terminal; connect the BLACK lead to negative. Then, connect the AC.

NOTE: Connect the battery before connecting the AC. The panel will not power up on the battery connection alone.

Step 7: Keypad Assignment (Section 2.5)

In order for keypads to be properly assigned, each must be assigned to a different address. Please follow the guidelines provided in Section 2.5 when assigning keypads.

Step 8: Supervision (Section 2.6)

The supervision of each module by the panel is automatically enabled upon power up. Please verify that all modules appear on the system according to the instructions in section 2.6.

Step 9: Programming the System (Sections 4 & 5)

Section 4 explains how to program the panel. Section 5 contains a complete description of the various programmable features, which options are available and how they function. Fill out the Programming Worksheets completely before attempting to program the system.

Step 10: Testing the System

Test the panel thoroughly to ensure that all features and functions are operating as programmed.

2.2 Terminal Descriptions

Battery Connection

A 12V 4Ah rechargeable battery is used as a backup source of power in the event of an AC power failure. The battery also provides additional current when the panel’s demands exceed the power output of the transformer, such as when the panel is in alarm.

NOTE: Do not connect the battery until all other wiring is complete. Connect the battery before connecting the AC.

Connect the RED battery lead to the positive battery terminal; connect the BLACK lead to negative.

The High Current / Standard Battery Charge option (section [701], option [7]) allows you to choose between a high current battery charge and the standard battery charge rate.

Enable the Automatic Battery Check option to have the panel perform a 10 second battery test upon disarming and at 1200h (noon).

NOTE: The panel will not perform the Automatic Battery Check if there is no AC present on the system.

AC Terminals – AC

The panel requires a 16.5VAC, 40VA transformer. Connect the transformer to an unswitched AC source and connect the transformer to these terminals.

The panel can be programmed to accept a power line frequency of either 50Hz AC or 60Hz AC in programming section [701], option [1].

NOTE: Do not connect the transformer until all other wiring is complete.

Auxiliary Power Terminals – AUX+ and AUX–

These terminals provide up to 550 mA of additional current at 12 Vdc for devices requiring power. Connect the positive side of any device requiring power to the AUX+ terminal, the negative side to AUX– (ground). The AUX output is protected. This means that if too much current is drawn from these terminals (such as a wiring short), the panel will temporarily shut off the output until the problem is corrected.

Bell Output Terminals – BELL+ and BELL–

These terminals provide up to 700 mA of continuous current at 12 Vdc for powering bells, sirens, strobes or other warning-type equipment. Connect the positive side of any alarm warning device to BELL+, the negative side to BELL–. Please note that the Bell output is protected: if too much current is drawn from these terminals (such as a wiring short), the Bell PTC will open. Three amps can be drawn for short periods only.

The Bell output is supervised. If no alarm warning devices are in use, connect a 1000Ω resistor across BELL+ and BELL– to prevent the panel from displaying a trouble condition. For more information, please refer to section 3.4 “[*] Commands” on page 8.
Keybus Terminals – AUX+, AUX-, YEL, GRN
The Keybus is used by the panel to communicate with modules and vice versa. Each module has four Keybus terminals that must be connected to the four Keybus terminals on the panel. For more information, see section 2.3 “Keybus Operation and Wiring”.

Programmable Output Terminals – PGM1 and PGM2
Each PGM output is designed so that when activated by the panel, the terminal will switch to ground. PGM1 can sink up to 300mA of current. Connect the positive side of the LED or buzzer to AUX+, the negative side to PGM1. If more than 300 mA of current are required, a relay must be used. Please study PGM wiring in the accompanying diagram.

PGM2 operates similarly to PGM1. However, PGM2 can only sink up to 50mA of current. For a list of the programmable output options, see section 5.11 “PGM Output Options” on page 20.

Zone Input Terminals – Z1 to Z4
Each detection device must be connected to a zone on the control panel. We suggest that one detection device be connected to each zone; wiring multiple detection devices to a single zone, however, is possible. For zone wiring specifics, please see section 2.8 “Zone Wiring” on page 5.

Telephone Connection Terminals – TIP, RING, T-1, R-1
If a telephone line is required for central station communication or downloading, connect an RJ-31X telephone jack in the following manner:

NOTE: For proper operation, no other telephone equipment should be connected between the control panel and the telephone company facilities. Do not connect the alarm panel communicator to telephone lines intended for use with a fax machine. These lines may incorporate a voice filter which disconnects the line if anything other than fax signals are detected, resulting in incomplete transmissions.

2.3 Keybus Operation and Wiring
The Keybus is used by the panel to communicate with all connected modules and vice versa. The red (AUX+) and black (AUX-) terminals are used to provide power, while the yellow (YEL) and green (GRN) terminals are clock and data respectively.

NOTE: The four Keybus terminals of the panel must be connected to the four Keybus terminals or wires of all modules.

The following restrictions apply to Keybus wiring:
• Keybus should be run in minimum 22 gauge quad (0.5mm); two pair twist is preferred.

• The modules should be home-run to the panel but can be connected in series or T-tapped.
• Any module can be connected anywhere along the Keybus. You do not need to run a separate Keybus wire for keypads, etc.
• No module can be more than 1,000'/305m (in wire length) from the panel.
• Shielded wire should not be used.

Example of Keybus Wiring
NOTE:
Module (A) is correctly wired within 1,000'/305m of wire from the panel.
Module (B) is correctly wired within 1,000'/305m of wire from the panel.
Module (C) is NOT wired correctly as it is further than 1,000'/305m from the panel, in wire distance.

2.4 Current Ratings – Modules and Accessories
In order for the PC585 system to operate properly, the power output capabilities of the main control and the expansion devices must not be exceeded. Use the data presented below to ensure that no part of the system is overloaded and cannot function properly.

PC585 (12 Vdc)
AUX+: ........550mA: Subtract the listed rating for each keypad, expansion module and accessory connected to AUX+ or Keybus.
BELL: .........700mA continuous rating; 3.0A short term. Available only with standby battery connected.

PC585 Device Ratings (at 12 Vdc)
• LCD5500Z Keypad: 85mA
• PC1555RKZ Keypad: 85mA
• PC5508Z Keypad: 75-85mA
• PC5400 Serial Module: 65mA
• PC5132 Wireless Receiver: 125mA

Other Devices
Please read the manufacturer’s literature carefully to determine the maximum current requirements for each device—during activation or alarm—and include the proper values for loading calculations. Connected devices must not exceed system capabilities during any possible operational mode.

2.5 Keypad Assignment
There are eight available addresses for keypads. LED keypads by default are always assigned to address 1. LCD5500Z keypads are always assigned to address 8. You will need to assign each keypad to its own address (1 to 8). Keypad assignment is required, as it tells the panel which addresses are occupied. The panel can then generate a fault when a keypad supervisory is not present.

NOTE: One LCD keypad must be assigned to address 8 in order to upload keypad programming using DLS-1 software.

How to Assign Keypads
Do the following at each keypad installed on the system:
1. Enter [*][8][installer’s code] to go to installer programming
2. Enter [000] for Keypad Programming

2.3 Keybus Operation and Wiring
The Keybus is used by the panel to communicate with all connected modules and vice versa. The red (AUX+) and black (AUX-) terminals are used to provide power, while the yellow (YEL) and green (GRN) terminals are clock and data respectively.

NOTE: The four Keybus terminals of the panel must be connected to the four Keybus terminals or wires of all modules.

The following restrictions apply to Keybus wiring:
• Keybus should be run in minimum 22 gauge quad (0.5mm); two pair twist is preferred.
3. Enter [0] for Address Assignment
4. Enter a two digit number (11-18) to specify which supervisory address the keypad will occupy.
5. Press [#] twice to exit installer programming.

After assigning all keypads, perform a supervisory reset by entering section [902] in installer’s programming. The panel will now supervise all assigned keypads and enrolled modules on the system.

**How to Program Function Keys**

By default, the 5 function keys on each keypad are programmed as Stay Arm (03), Away Arm (04), Chime (06), Sensor Reset (14) and Quick Exit (16). You can change the function of each key on every keypad:
1. Go to the keypad where you want to change the function key programming and enter Installer Programming.
4. Enter the 2 digit number, [00] to [17] to select the feature you want the function key to have. For a complete list of Function Key options see section 3.5 “Function Keys” on page 11.
5. Continue from step 3 until all function keys are programmed.
6. To exit Installer Programming, press [#] twice.

**2.6 Supervision**

By default, all modules are supervised upon installation. Supervision is enabled at all times so that the panel can indicate a trouble if a module is removed from the system.

To check on which modules are currently connected and supervised, enter programming section [903] from installer’s programming. The LCD keypad will allow you to scroll through the display of connected modules. A connected module which does not show as being present will appear as a trouble condition and the Trouble light on the keypad will turn ON. This condition may be due to one or more of the following reasons:
- the module is not connected to the Keybus
- there is a Keybus wiring problem
- the module is more than 1,000'/305m from the panel
- the module does not have enough power

For more information regarding module supervision troubles, please refer to “[*][2] Trouble Display” on page 9.

**2.7 Removing Modules**

The panel must be instructed to no longer supervise a module being removed from the system. To remove the module, disconnect it from the Keybus and reset the supervision field by entering [902] in the installer’s programming. The panel will be reset to recognize and supervise all existing modules on the system.

**2.8 Zone Wiring**

For a complete description of the operation of all zone types, please refer to section 5.2 “Zone Programming” on page 14. There are several different ways in which zones may be wired, depending on which programming options have been selected. The panel can be programmed to supervise normally closed, End of Line, or Double End of Line loops. Please refer to the following diagrams to study each type of individually supervised zone wiring.

**NOTE:** Any zone programmed for Fire or 24 Hour Supervisory must be wired with a single End of Line (EOL) resistor regard-
**NOTE:** This option can only be selected if Normally Closed (NC) detection devices or contacts are being used.

**NOTE:** Only one NC contact can be connected to each zone. Wiring multiple detection devices or contacts on a single loop is not allowed.

The following chart shows zone status under certain conditions:

<table>
<thead>
<tr>
<th>Loop Resistance</th>
<th>Loop Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>0Ω (shorted wire, loop shorted)</td>
<td>Fault</td>
</tr>
<tr>
<td>5600Ω (contact closed)</td>
<td>Secure</td>
</tr>
<tr>
<td>Infinite (broken wire, loop open)</td>
<td>Tamper</td>
</tr>
<tr>
<td>11200Ω (contact open)</td>
<td>Violated</td>
</tr>
</tbody>
</table>

**2.9 Fire Zone Wiring**

### 4-Wire Smoke Detectors

All fire zones must be wired according to the following diagram:

**LINKS Supervision (24 Hour Supervisory)**

When using the LINKS 1000 cellular communicator, any main board zone may be configured for LINKS Supervision. Program this zone as zone type [09], 24 Hour Supervisory in section [001].

With a LINKS Supervisory zone, if the LINKS 1000 experiences a trouble, the zone will be violated, causing the panel to report the event to the central station. This type of zone always requires a single EOL resistor (5600Ω). Wire this zone according to the above diagram.

### LINKS Answer

When using the LINKS 1000 cellular communicator, any main board zone may be configured for LINKS Answer.

A zone configured for LINKS Answer allows downloading to be performed in the event of telephone line failure. When the LINKS receives a telephone call, it will activate the RING terminal on the LINKS circuit board. The zone programmed as LINKS Answer always requires a single EOL resistor (5600Ω). Wire the LINKS Answer zone according to the above diagram.

**NOTE:** The LINKS Answer zone is only required for downloading to the panel via the LINKS.

**NOTE:** When using the LINKS, Busy Tone Detection must not be used.

**NOTE:** Keypad zones cannot be used for 24 Hour Supervisory or LINKS Answer.

### 2.11 Keypad Zones

Each “z” keypad on the system has a zone input to which a device - such as a door contact - can be connected. This eliminates the need to run wires back to the control panel for every device.

To install the keypad, open the keypad plastic by removing the screw at the bottom of the unit. Locate the five terminals on the keypad circuit board. Connect the four Keybus wires from the control panel; the red wire to R, the black to B, the yellow to Y and the green to G.

To connect the zone, run one wire to the Z terminal and the other to B. For powered devices, use red and black to supply power to the device. Run the red wire to the R (positive) terminal and the black wire to the B (negative) terminal.
When using end of line supervision, connect the zone according to one of the configurations outlined in section 2.8 “Zone Wiring” on page 5. End of line resistors must be placed on the device end of the loop, not at the keypad.

**NOTE:** Keypad zones do not support DEOL resistors.

### Assigning Keypad Zones

When using keypad zone inputs, each input used must be assigned a zone number in Installer's Programming.

First, ensure that you have enrolled all installed keypads into the desired addresses. (See section 2.5 “Keypad Assignment” on page 4.)

Next, enter programming section [020] to assign the zones. There are eight programming locations in this section, one for each keypad address. Enter a 2-digit zone number for each of the keypad zones. This number must be entered in the location corresponding to the keypad to which each zone is connected.

**Example:** The zone on an LCD5500Z keypad in address 8 is to be assigned zone 3. In section [020], scroll to option [8] and enter (03).

**NOTE:** Keypad zones 1-4 will replace zone terminals Z1-Z4 on the control panel.

**NOTE:** Once the keypad zones are assigned, you must also program zone definitions and zone attributes. (See also section 5.4 “Assigning Keypad Zones” on page 16.)
Section 3: Keypad Commands

Use any system keypad to enter commands and/or program the PC585 security system. The LED keypad uses function and zone indicator lights to represent alarm functions and status. If you have a PC1555RKZ keypad, the System light acts as a Trouble, Memory, Program and Bypass indicator. Unlike other LED keypads, these conditions will only be represented by the System light.

The LCD keypad provides a written description on the liquid crystal display and uses function indicator lights to communicate alarm status to the user.

The PC585 Instruction Manual provides basic directions for arming and disarming the system, bypassing zones and performing user functions from the keypads. The following sections provide additional details on these functions.

3.1 Arming and Disarming

For a description of basic arming and disarming, please see the PC585 Instruction Manual. For other methods of arming, please refer to section 3.4 "[*] Commands" and section 3.5 “Function Keys” on page 11.

NOTE: The Event Buffer will log “Armed in Stay Mode” or “Armed in Away Mode” whenever the system is armed.

In an attempt to prevent false alarms, the Audible Exit Fault will notify the user of an improper exit when they arm their system. If a non force-arming Delay 1 or Delay 2 type zone is left open at the end of the exit delay, the entry delay will begin immediately and the bell or siren will sound a steady alarm for the entry delay period. At the end of the entry delay period, if the system has not been disarmed it will go into alarm. This feature can be turned OFF in programming section [013], option [6]. (See section 5.17 “Arming/Disarming Options” on page 23 for more information.)

3.2 Auto Bypass – Stay Arming

Stay arming allows the user to arm the system without leaving the premises. All zones programmed as stay/away will be bypassed when the user stays the system, so that the user does not have to bypass interior zones manually. (See section 5.2 “Zone Programming” on page 14.)

When the system is armed using a valid access code, if any zones on the system have been programmed as stay/away zones, the Bypass light will turn ON. The panel will then monitor all zones programmed as Delay 1 and Delay 2 type zones. If a delay zone is not violated by the end of the exit delay, the panel will bypass all delay/away zones. The Bypass light will remain on to inform the user that the interior zones have been automatically bypassed by the panel. If a delay zone is violated during the exit delay, the system will arm in Away mode and all stay/away zones will be active after the exit delay expires.

The user can arm the stay/away zones at any time by entering the "[*][1] keypad command (see “[*][1] Bypassing and Activating Stay/Away Zones”).

Stay arming can also be initiated by pressing and holding the Stay function key for two seconds on the PC5508Z and LCD5500Z keypads, if programmed by the installer. For more information regarding Stay arming, please see section 3.5 “Function Keys” on page 11.

3.3 Automatic Arming

The system can be programmed to Auto-Arm at a specific time every day if it is in the disarmed condition. In order for the Auto-Arm function to work properly, you must program the correct Time of Day. For programming the clock and auto-arm times, see "[*][6] User Functions” on page 10.

When the system’s internal clock matches the Auto-Arm Time, the panel will check the system status. If the system is armed, the panel will do nothing until the next day at the auto-arm time, when it will check the system again. If the system is disarmed at the auto-arm time, the panel will sound the buzzer of all keypads for one minute. If the Bell Squawk During Auto Arm option is enabled (section [014], option [2]), the bell will squawk once every 10 seconds while the system is auto-arming. If a valid access code is entered, auto-arming will be cancelled.

NOTE: If auto-arm is cancelled, the number of the user who cancelled the auto-arm will be logged in the event buffer.

If no code is entered, the panel will auto-arm. If a zone is violated, the panel will transmit a Partial Closing Reporting Code – if programmed – to indicate to the central station that the system is not secure. If the zone is restored, the panel will add the zone back into the system.

NOTE: Auto arming can only be cancelled by entering a valid access code at any keypad.

3.4 [*] Commands

The [*] key commands provide an easy way for the user to access basic system programming – such as programming access codes or bypassing zones. The user can also use the [*] key commands to check on the system’s status, including viewing trouble conditions and displaying the event buffer on the LCD keypad.

The [*] key commands can be performed from both LCD and LED keypads. The LED keypad uses the zone indicator lights to display command information. The LCD display provides written information, guiding the user through each command. The commands in this section are explained as viewed from an LED keypad. When using an LCD keypad, use the arrow keys (< >) to scroll through information provided. Otherwise, the functions remain the same for both keypad types.

[*][1] Bypassing and Activating Stay/Away Zones

Use the [*][1] keypad command to bypass individual zones. A bypassed zone will not cause an alarm.

NOTE: Zones can only be bypassed when the system is not armed.

If the Code Required for Bypass option is enabled (section [015], option [5]), only access codes with the bypass attribute enabled will be able to bypass zones (see section 5.1 “Programming Security Codes” on page 14).

If the Bypass Status Displayed While Armed option is chosen, the Bypass (or System) light will be ON while the system is armed to indicate any bypassed zones (see section 5.17 “Arming/Disarming Options” on page 23).

NOTE: When you disarm the system, all manually-bypassed zones will be unbypassed.
Activate Stay/Away Zones
If the system is armed in stay mode, the [*][1] command can be used to activate the stay/away zones.

[*][2] Trouble Display
The panel constantly monitors itself for several different trouble conditions. If a trouble condition is present, the Trouble (or System) light will be on and the keypad will beep twice every 10 seconds. When the system is disarmed, users can silence the Trouble beeps for faults and tampers by entering an access code. For other troubles, users can silence the Trouble beep pressing any key at any system keypad.

If Bell Squawk on Trouble is enabled (section [014], option [5]), the bell will squawk every 10 seconds when a trouble condition is present.

If the Troubles are Latching option is enabled, when a trouble restores before a user has viewed it (via [*][2]), the Trouble (or System) LED will stay on (latch). Once a user has viewed the trouble, the LED will turn off (unless other troubles are present on the system).

Troubles are Latching . . . . . . . . . . . . . . . . .Section [018]: [1]

To view trouble conditions from an LED keypad:
1. Press [*][2].
2. The keypad will flash the Trouble (or System) light. The zone indicator lights corresponding to the present trouble conditions will be ON.

NOTE: Troubles can be viewed while armed using the LCD keypad, provided the keypad is version 2.0 or later. Older keypads will incorrectly display “Fire Trouble”. If using older LCD keypads, programming section [013], option [3] as OFF will ensure troubles are displayed correctly.

The various troubles are described below:

<table>
<thead>
<tr>
<th>Light</th>
<th>Trouble</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Service Required: Press [1] to determine the specific trouble. Lights 1 - 5 will light up to indicate the trouble:</td>
</tr>
<tr>
<td></td>
<td>• Light [1] Low Battery: Main panel backup battery charge is low (below 11.5 volts under load). Trouble is restored when the battery charges over 12.5 volts.</td>
</tr>
<tr>
<td></td>
<td>• Light [2] Bell Circuit Trouble: The bell circuit is open (see section 5.13 “Bell” on page 22).</td>
</tr>
<tr>
<td></td>
<td>• Light [3] General System Trouble: The printer connected to the PCS400 Printer module has a fault and is off-line.</td>
</tr>
<tr>
<td></td>
<td>• Light [4] General System Tamper: Tamper has been detected in a module.</td>
</tr>
<tr>
<td></td>
<td>• Light [5] General System Supervisory: The panel has lost communication with a module connected to the Keybus (see section 2.6 “Supervision” on page 5). The event buffer will log the event.</td>
</tr>
<tr>
<td></td>
<td>NOTE: All tamper conditions must be physically restored before the trouble condition will clear.</td>
</tr>
<tr>
<td></td>
<td>• Lights [6-8] – Not used</td>
</tr>
<tr>
<td></td>
<td>NOTE:</td>
</tr>
<tr>
<td>2</td>
<td>AC Failure: AC power is no longer being supplied to the control panel. The Trouble (or System) light will flash if an AC Failure is present, if the Trouble Light Flashes if AC Failure option is programmed (section [016], option [2]). This trouble will not be displayed if the AC Trouble Displayed option is disabled (section [016], option [1]). See section 5.8 “Communicator – Reporting Codes” on page 17 for information on AC trouble reporting.</td>
</tr>
<tr>
<td>3</td>
<td>Telephone Line Monitoring Trouble (TLM): There is a problem with the telephone line (See section 5.12 “Telephone Line Monitor (TLM)” on page 22.)</td>
</tr>
<tr>
<td>4</td>
<td>Failure to Communicate (FTC): The communicator failed to communicate with any of the programmed telephone numbers (see section 5.5 “Communicator – Dialing” on page 16).</td>
</tr>
<tr>
<td>5</td>
<td>Zone Fault (including Fire Zone): A zone on the system is experiencing trouble, meaning that a zone could not provide an alarm to the panel if required to do so (e.g. a fire zone is open, or there is a short on a DEOL zone, or a supervisory fault on a wireless zone). When a zone fault trouble condition occurs, the keypad(s) on the system will start to beep. Press [5] while in Trouble mode to view the affected zones.</td>
</tr>
<tr>
<td></td>
<td>NOTE: A Fire zone trouble will be generated and displayed in the armed state.</td>
</tr>
<tr>
<td>6</td>
<td>Zone Tamper: A zone configured for Double End Of Line resistor supervision has a tamper condition, or the tamper switch is open on a wireless device. When a tamper condition occurs, the keypad(s) will start to beep. Press [6] while in the Trouble mode to view the affected zones. If a zone is tampered or faulted, it must be fully restored to clear the trouble.</td>
</tr>
<tr>
<td></td>
<td>NOTE: By enabling Tampers/Faults Do Not Show as Open in section [013], option [4], Faults and Tampers will not show as open on the keypad, and will be hidden from the user. If the option is disabled, Faults and Tampers will be displayed on the keypad</td>
</tr>
<tr>
<td></td>
<td>NOTE: Once a zone is tampered or faulted, it must be completely restored before the trouble condition will clear.</td>
</tr>
<tr>
<td>7</td>
<td>Device Low Battery: A wireless device has a low battery condition. Press [7] one, two, or three times to view which devices are experiencing battery failure. An LED keypad will indicate battery failure using zone lights 1 to 8. The following will occur:</td>
</tr>
<tr>
<td></td>
<td>Keypad beeps: Keypad displays:</td>
</tr>
<tr>
<td></td>
<td>Press [7] 1 Zones with low batteries (LED keypad - zone lights 1 to 8)</td>
</tr>
<tr>
<td></td>
<td>Press [7] again 2 Handheld keypads with low batteries (LED keypad - zone lights 1 to 4)</td>
</tr>
<tr>
<td></td>
<td>Press [7] again 3 Wireless keys with low batteries (LED keypad - zone lights 1 to 8)</td>
</tr>
<tr>
<td></td>
<td>To view the battery conditions of wireless keys 9 through 16, you must use an LCD keypad.</td>
</tr>
<tr>
<td>8</td>
<td>Loss of System Time: When the panel is powered up, the internal clock needs to be set to the correct time. This trouble is cleared when an attempt is made to reset the clock.</td>
</tr>
</tbody>
</table>

[*][3] Alarm Memory
The Memory (or System) light will be on if any alarm occurred during the last armed period or – in the case of 24 hour zones – if an alarm occurred while the panel was disarmed.

To view alarm memory, press [*][3]. The keypad will flash the Memory (or System) light and the zone indicator lights corresponding to the alarm or tamper conditions which occurred during or since the last armed period. To clear the Memory (or System) light, arm and disarm the system.

[*][4] Door Chime On/Off
The door chime feature is used to sound a tone from the keypad whenever a zone programmed as a chime zone is acti-
vated (see section 5.3 “Zone Attributes” on page 15). If the door chime feature is enabled, the keypad will emit five short beeps whenever a chime zone is activated. Designated entry/exit doors are often defined as chime zones. The feature can be turned on or off while the system is armed or disarmed.

[*][5] Programming Access Codes

There are 37 access codes available to the user. They are:
- Access code (40)................. One master code
- Access codes (01)-(32)......... 32 general access codes
- Access codes (33)-(34)......... Two duress codes
- Access codes (41)-(42)......... Two supervisor codes

All access codes have the ability to arm or disarm the system and can activate the PGM Outputs using the [*][7] commands. Access codes can be either four or six digits (see section 5.1 “Programming Security Codes” on page 14).

For a description of how to program access codes from LCD or LED keypads, see the PC585 Instruction Manual.

Master Code – Access Code (40)

By default, the Master Code is enabled to perform any keypad function. This code can be used to program all access codes. If the Master Code Not Changeable option is enabled (section [015], option [6]), the Master Code can only be changed by the Installer.

General Access Codes – Access Codes (01) to (32)

General access codes can arm and disarm the system. When the Code Required for Bypassing option is enabled, users will need to enter a valid access code when bypassing zones. Individual access codes can have the Zone Bypassing attribute disabled under Access Code Attribute programming. For more information regarding access code options, please see section 5.1 “Programming Security Codes” on page 14.

Duress Code – Access Code (33) and (34)

Duress codes will send a duress reporting code to the central station when entered.

NOTE: If a duress code is programmed, when it is used, the panel will always send a reporting code to the central station, even if the attributes of the duress code are turned off.

Supervisor Codes – Access Code (41) and (42)

These codes can be used to program general access and duress codes. The two supervisor codes have master code attributes by default. These settings can be changed.

Access Code Attributes

There are two access code attributes which can be programmed for each code. To program each attribute, enter [*][5][Master Code][9] to enter the attribute programming mode. Then enter the code number [01-32,33,34,41,42]. Enter the attribute number:
- Attribute [1]........... User enabled for arming, disarming, alarm reset, [*][7][1-2] options, auto arm cancellation
- Attribute [2]........... Not used
- Attribute [3]........... Zone bypassing enabled
- Attribute [4]........... Not used

NOTE: Master code attributes cannot be changed.

[*][6] User Functions

This command can be used to program several different functions:

To program User Functions:
1. Press [*][6][Master Code]. The Program (or System) light will flash.
   - [1] – Time and Date
   - [3] – Auto-Arm Time
   - [4] – System Test
   - [5] – Enable DLS (Downloading)
   - [6] – User Initiated Call-Up

Additional Features Available from the LCD Keypad

Additional features, including access to the event buffer, are available using the LCD keypad. Use the arrow keys (< >) to scroll through the [*][6] menu and press the [*] key to select the following commands:

Viewing the Event Buffer from an LCD Keypad

Select “View Event Buffer” from the [*][6] menu. The keypad will display the event, event number, time and date along with the zone number and access code, if applicable. Press [*] to toggle between this information and the event itself. Use the arrow keys (< >) to scroll through the events in the buffer. When you have finished viewing the event buffer, press [#] to exit.

Brightness Control

You can select from 10 different backlighting levels. Use the arrow keys (< >) to scroll to the desired backlighting level. Press [#] to exit.

Contrast Control

You can select from 10 different display contrast levels. Use the arrow keys (< >) to scroll to the desired contrast level. Press [#] to exit.

Keypad Sounder Control

You can select from 21 different keypad tones. Use the arrow keys (< >) to scroll to the desired keypad sound level and press [#] to exit. This feature can be accessed on LED keypads by pressing and holding the [*] key.

[*][7] Command Output Functions

The user can activate programmable output functions using the [*][7][1-2] commands. The outputs may be activated when the system is either armed or disarmed.

[*][7][1] – Command Output Option #1:
Press [*][7][1][Access Code, if required] to activate outputs programmed as PGM output option [19]. This output can be used for operating devices such as a garage door opener, lighting or door strikers.
Keypad Commands: 3.5 Function Keys

[*][7][2] – Command Output Option #2:
Press [*][7][2][Access Code, if required] to activate all outputs programmed as one of PGM output options [03] or [20].

Special Note: Traditionally, [*][7][2] has been reserved for resetting smoke detectors. Smoke detectors should now be programmed as output [03] “Sensor Reset”. If using output option [03], do not program [20] Command Output Option #2. Please see section 5.11 “PGM Output Options” on page 20 for more information.

[*][8] Installer’s Programming
Enter [*][8] followed by the Installer’s Code to access Installer’s Programming. See sections 4 and 5 for more information.

[*][9] Arming Without Entry Delay
When the system is armed with the [*][9] command, the panel will cancel the entry delay. Delay 1 and Delay 2 type zones will be instant and Stay/Away zones will be bypassed as soon as the exit delay has ended (see section 5.2 “Zone Programming” on page 14). The user must enter a valid access code after pressing [*][9].

[*][0] Quick Arm
If the Quick Arm option is enabled, enter [*][0] to arm the panel without an access code (See section 5.17 “Arming/Disarming Options” on page 23).

NOTE: Quick Arm cannot be used to cancel auto arm.

[*][0] Quick Exit
The Quick Exit function, if enabled, will allow someone to leave an armed premises through a Delay type zone without having to disarm and re-arm the system (see section 5.17 “Arming/Disarming Options” on page 23). When [*][0] is entered, the panel will provide a two minute window for the user to exit the premises. During this time, the panel will ignore only one activation of a Delay zone. When the Delay zone is secured, the panel will end the two minute quick exit delay.

If a second Delay zone is tripped, or if the zone is not restored after two minutes, the panel will begin the entry delay.

NOTE: If the Exit Delay is in progress, performing a Quick Exit will not extend the Exit Delay.

3.5 Function Keys
There are five function keys on each keypad labelled Stay, Away, Chime, Reset and Exit. Each key is programmed by default to perform one of the functions described below. Press and hold the appropriate key for two seconds to activate a function.

NOTE: On the PC1555RKZ keypad, use number keys 1 - 5 for the function keys.

“Stay” – (03) Stay Arm
The system will arm in the Stay mode (see section 3.2 “Auto Bypass – Stay Arming” on page 8). Enable the Quick Arm feature (programming section [015], option [4]) to have this key function without the need to enter an access code. If Quick Arm is not enabled, the user will have to enter an access code before the system will stay arm.

“Away” – (04) Away Arm
The system will arm in the Away mode (see section 3.2 “Auto Bypass – Stay Arming” on page 8). Enable the Quick Arm feature (programming section [015], option [4]) to have this key function without the need to enter an access code. If Quick Arm is not enabled, the user will have to enter an access code before the system will away arm.

“Chime” – (06) Door Chime On / Off
The Door Chime feature will turn ON or OFF (see “[*][4] Door Chime On/Off” on page 9).

“Reset” – (14) Sensor Reset or [*][7][2]
The panel will activate all PGM outputs programmed as option [03] Sensor Reset or [20] Command Output Option #2. (See “[*][7] Command Output Functions” on page 10).

“Exit” – (16) Activate Quick Exit
The panel will activate the Quick Exit feature (See section 3.4 “[*] Commands” on page 8).

Additional Function Key Options
The programming of any function key on any keypad may be changed to one of the options listed below. (See section 2.5 “Keypad Assignment” on page 4 for instructions on changing function key programming.) Each option is listed according to the programming code, followed by the corresponding [*] key command. For more information regarding each function, please refer to the appropriate part of section 3.4 “[*] Commands” on page 8.

[00] Null Key: The key is not used and will perform no function when pressed.
[01]-[02] For future use
[03] Stay Arm: As described above.
[04] Away Arm: As described above.
[05] [*][9] No-Entry Delay Arm: A valid access code must also be entered.
[06] [*][4] Door Chime On / Off: As described above.
[07] [*][6][----][4] System Test: A valid master code must also be entered.

[08] [*][1] Bypass Mode: A valid access code may need to be entered.
[09] [*][2] Trouble Display
[13] [*][7][1] Command Output Option #1: A valid access code may need to be entered.
[14] [*][7][2] Reset (Command Output Option #2): As described above.
[15] For future use
[16] [*][0] Quick Exit: As described above.
[17] [*][1] Reactivate Stay/Away Zones

3.6 Features Available for the LCD5500Z
These features are only available for LCD5500Z keypads with zone inputs:

Automatic Scrolling of Alarms in Memory
The LCD5500Z keypad allows automatic scrolling through alarms in memory while the keypad is idle. This feature, if enabled, will override the clock display. This option can be programmed in LCD programming section [66], option [4].

24 Hour Time Display Option
Each LCD5500Z can be programmed to display time using a 24-hour display, instead of a 12-hour am/pm clock. Program this option in LCD programming section [66], option [3].

Keypad Zones
See section 2.11 “Keypad Zones” on page 6.

Viewing Troubles While Armed
See section “[*][2] Trouble Display” on page 9 for information on how to view troubles.

Backlighting Boost
The LCD5500Z, PC1555RKZ and PC5508Z zone input keypads will provide extra number pad lighting when any key is pressed. The backlighting boost will last for an additional 30 seconds after the last keypress.
Section 4: How to Program

The following section of the manual describes the Installer's Programming function and how to program the various sections.

**NOTE:** Read the following section of the manual very carefully before you begin programming. We also recommend filling out the Programming Worksheets section before you program the panel.

For your reference, the corresponding programming sections for the functions listed are highlighted in text boxes such as this one.

### 4.1 Installer’s Programming

Installer’s Programming is used to program all communicator and panel options. The Installer’s Code is [585] by default but should be changed to prevent unauthorized access to programming.

**Installer’s Code ..................................  Section [006]**

#### From an LED Keypad:

1. Enter [*][8][Installer’s Code].
   - The Program light (or System light on the PC1555RKZ) will flash to indicate that you are in programming mode.
   - The Armed light will turn on to indicate that the panel is waiting for the three-digit programming section number.
2. Enter the three-digit section number corresponding to the section you wish to program.
   - The Armed light will turn off.
   - The Ready light will turn on to indicate that the panel is waiting for the information required to complete programming the selected section.
3. Enter the information required to complete section programming (i.e.: numbers, HEX data, or ON/OFF options).
   - **NOTE:** If the three-digit section number entered is invalid, or if the module which pertains to the section is not present, the keypad will sound a two second error tone.

#### From an LCD Keypad:

1. From any keypad, enter [*][8][Installer’s Code]. The Keypad will display ‘Enter Section’ followed by three dashes.
2. Enter the three-digit number corresponding to the programming section number you wish to program.
   - The Keypad will now display the information required to complete programming the selected section.
3. Enter the information required to complete section programming (i.e.: numbers, HEX data, or ON/OFF options).
   - **NOTE:** If Ready light is flashing, any number you enter will be programmed as the HEX equivalent.

### 4.2 Programming Decimal Data

A set number of programming boxes are allotted for each section requiring decimal data (e.g.: codes, telephone numbers). If a digit is entered for each program box, the panel will automatically exit from the selected programming section. The Ready light will turn OFF and the Armed light will turn ON.

On the PC1555RKZ and PC5508Z keypads, you can also press the [#] key to exit a programming section without entering data for every box. This is handy if you only need to change digits in the first few programming boxes. All other digits in the programming section will remain unchanged.

### 4.3 Programming HEX Data

On occasion, hexadecimal (HEX) digits may be required. To program a HEX digit press the [*] key. The panel will enter HEX programming and Ready light will begin to flash.

#### Example:

To enter ‘C1’ for a closing by user 1, you would enter:

[*][3][*, 1]:
- [*] to enter Hexadecimal mode (Ready light flashes)
- [3] to enter C
- [*] to return to decimal mode (Ready light is solid)
- [1] to enter digit 1

**NOTE:** If Ready light is flashing, any number you enter will be programmed as the HEX equivalent.

If you are using a pulse communications format, a decimal zero [0] does not transmit. Programming a zero [0] tells the panel not to send any pulses for that digit. Decimal zero [0] is a filler digit. To transmit a zero [0], it must be programmed as a Hexadecimal ‘A’.

#### Example:

For the three digit account number ‘403’, you would enter:

[4], [*][1][*, 3], [0]:
- [4] to enter the digit 4
- [*] to enter Hexadecimal mode (Ready light flashes)
- [1] to enter A
- [*] to return to decimal mode (Ready light is solid)
- [3] to enter the digit 3
- [0] to enter the digit 0 as a filler digit.

**NOTE:** There must be one digit in each box in the programming section in order for the change to be valid.
4.4 Programming Toggle Option Sections
Some programming sections contain several toggle options. The panel will use zone lights 1 through 8 to indicate if the different options are enabled or disabled. Press the number corresponding to the option to turn it ON or OFF. Once all the toggle options have been selected correctly, press the [#] key to exit the section and save the changes. The Ready light will turn OFF and the Armed light will turn ON. Refer the programming worksheets to determine what each option represents and whether the light should be ON or OFF for your application.

4.5 Viewing Programming

LED Keypads
Any programming section can be viewed from an LED keypad. When a programming section is entered, the keypad will immediately display the first digit of information programmed in that section.

The keypad displays the information using a binary format, according to the following chart:

<table>
<thead>
<tr>
<th>Value</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
<th>F</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zone 1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Zone 2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Press any of the Emergency Keys (Fire, Auxiliary or Panic) to advance to the next digit. When all the digits in a section have been viewed, the panel will exit the section; the Ready Light will turn OFF and the Armed light will turn ON, waiting for the next three-digit programming section number to be entered. Press the [#] key to exit the section.

LCD Keypad
When a programming section is entered, the keypad will immediately display all the information programmed in that section. Use the arrow keys (< >) to scroll through the data being displayed. Scroll past the end of the data displayed or press the [#] key to exit the section.
Section 5: Program Descriptions

The following section explains the operation of all programmable features and options and provides a summary of all corresponding programming locations.

5.1 Programming Security Codes

There are three codes which can be programmed by the installer in the Installer's Programming function: the Master code, the Installer's code, and a Maintenance code. All other access codes can be programmed through the [*][5] command (see section 3.4 "[*] Commands" on page 8).

The master code can also be programmed by the user as access code (40). If the Master Code Not Changeable option is enabled, the system master code can only be changed by the installer.

General access codes can arm and disarm the system. When the Code Required for Bypassing option is enabled, users will need to enter a valid access code when bypassing zones. Individual access codes can have the Zone Bypassing attribute disabled under access code attribute programming (see section 3.4 "[*] Commands" on page 8).

If the 6-Digit User Access Codes option is enabled, all the access codes may be programmed with six digits instead of four, with the exception of the Panel ID code and the Downloading Access code.

- Installer's Code .................................. Section [006]
- Master Code .................................... Section [007]
- Maintenance Code .............................. Section [008]
- Master Code Not Changeable ........ Section [015]: [6]
- Code Required for Bypassing .......... Section [015]: [5]
- 6-digit User Access Codes .............. Section [701]: [5]

**NOTE:** The Maintenance code is limited to arming and disarming the system. The Maintenance code cannot use [*][9] to arm the system, bypass zones, or perform [*][7] command functions.

5.2 Zone Programming

All eight zones are enabled by default. Unused zones should be disabled in programming section [202].

Section [001] will allow you to select how each of the zones you use will operate. Each zone requires a two-digit code to be programmed, which describes the zone definition. Select a definition from the list below.

In addition, each zone has eight different attributes which may be programmed in sections [101] to [108] (see section 5.3 “Zone Attributes” on page 15).

**Zone Definitions**

- **[00] Null Zone**
  The zone is vacant. Unused zones should be programmed as Null zones.

- **[01] Delay 1 Zone**
  This zone type, normally used for entry/exit doors, can be violated during the exit delay time without causing an alarm. Once the exit delay has expired, opening the zone will start the entry delay timer. During the entry delay time, the keypad buzzer will sound steadily to advise the user that the system should be disarmed. If the panel is disarmed before the entry time expires, no alarm will be generated.

- **[02] Delay 2 Zone**
  The Delay 2 entry delay time can be set independently of Delay 1 in programming section [005] (System Times).

- **[03] Instant Zone**
  This zone type will cause an instant alarm if it is violated when the panel is armed. Typically, this zone is used for windows, patio doors or other perimeter zones, and glass break detectors.

- **[04] Interior Zone**
  This zone will not cause an alarm if violated during the entry delay. If the zone is violated before the entry delay has begun, it will cause an instant alarm. Typically, this zone is used for interior protection devices, such as motion detectors.

- **[05] Interior Stay/Away Zone**
  This zone type works similarly to the Interior zone type, except that it will be automatically bypassed under the following conditions:
  - When the panel is armed in the Stay Mode (see section 3.5 “Function Keys” on page 11).
  - When the panel is armed without entry delay (see “[*][9] Arming Without Entry Delay” on page 11).
  - When the panel is armed with an access code and a Delay type zone is NOT tripped during the exit delay.

  The automatic bypass prevents the user from having to manually bypass interior type zones when arming at home. This zone is typically used for interior protection devices, such as motion detectors.

- **[06] Delay Stay/Away Zone**
  This zone type will operate similarly to Interior Stay/Away zones, except that it will always provide an entry delay. Typically, this zone is used for interior protection devices, such as motion detectors. This zone option will help prevent false alarms since it always provides an entry delay time for the user to turn off the panel.

  **NOTE:** Hardwire motion detectors covering entry/exit doors that are using wireless transmitters must be programmed as Delay Stay/Away. If not, the panel may see the motion detector violation before the entry/exit transmitter has time to transmit to the receiver, causing a false alarm.

- **[07] Delayed 24 Hour Fire Zone**
  **NOTE:** Do not wire Fire zones on keypad zone terminals if the DEOL supervision option is enabled for the panel (section [013], option [2]).

  When this zone is violated, the alarm output will be immediately activated (pre-alarm) but the communicator will be delayed for 30 seconds. If the user presses any key on any keypad during this delay, the alarm output and the communicator will be delayed an additional 90 seconds, giving the user time to correct the problem. If the zone is still violated after the 90 second delay, the panel will sound the alarm output and delay the communicator for 30 seconds.

  If the user does not press a key during the 30 second pre-alarm, the alarm output will latch and the panel will communicate the alarm to the central station. The alarm will sound until the Bell Cutoff time expires (Section [005] “System Times”), or until a code is entered (see Section 5.13 “Bell” on page 22).
NOTE: If a second Fire type zone is violated or if the Fire keys are pressed during the delay period, the panel will latch the alarm output and will immediately communicate the alarm.

A violated Fire zone will be displayed on all keypads and can be delayed at any keypad. Typically this zone is used for latching smoke detectors.

[08] Standard 24 Hour Fire Zone
NOTE: Do not wire Fire zones on keypad zone terminals if the DEOL supervision option is enabled for the panel (section [013], option [2]).

When this zone is violated, the panel will immediately latch the alarm output and communicate to the central station. The alarm will sound until the Bell Cutoff time expires, or until a code is entered (see section 5.13 “Bell” on page 22).

A violated Fire zone will be displayed on all keypads. Typically this zone is used for pull stations.

[09] 24 Hour Supervisory Zone
If this zone is violated when the system is either armed or disarmed, the panel will report to the central station, and will log the zone alarm to the Event Buffer. This zone gives a silent alarm by default.

NOTE: Do not wire 24-Hour Supervisory zones on keypad zone terminals.

[10] 24 Hour Supervisory Buzzer Zone
If this zone is violated when the system is either armed or disarmed, the panel will immediately latch the keypad buzzer until a valid access code is entered and will immediately communicate to the central station.

If this zone is violated when the system is either armed or disarmed, the panel will immediately latch the alarm output and communicate to the central station. The alarm will sound until the Bell Cutoff time expires, or until a code is entered (see section 5.13 “Bell” on page 22).

[12] - [20]
The following zone definitions operate similar to the 24 Hour Burglary except for the System Event output type and the SIA identifier:

[12] 24 Hour Holdup Zone - This zone gives a silent alarm by default.

[13] 24 Hour Gas Zone
[14] 24 Hour Heat Zone
[15] 24 Hour Medical Zone
[16] 24 Hour Panic Zone
[17] 24 Hour Non-Medical Emergency Zone
[18] 24 Hour Sprinkler Zone
[19] 24 Hour Water Flow Zone
[20] 24 Hour Freezer Zone

[21] 24 Hour Latching Tamper
If this zone is violated, the installer must enter Installer’s Programming before the system can be armed.

NOTE: Wireless zones should not be programmed as zone types [22] - [24].

[22] Momentary Keyswitch Arm Zone
Momentary violation of this zone will alternately arm/disarm the system. Tamper alarms and faults will not arm/disarm the system, but only activate the appropriate trouble.

[23] Maintained Keyswitch Arm Zone
When this zone is violated, the system will arm. When this zone is secured, the system will disarm. Tamper alarms and faults will not arm/disarm the system, but only activate the appropriate trouble.

[24] LINKS Answer Zone
Downloading can be performed via the LINKS1000 Cellular Communicator (if used) when the conventional telephone line is disconnected. If this operation is desired, connect the RING terminal of the LINKS1000 to a LINKS Answer zone (see section 2.10 “LINKS Zone Wiring” on page 6). Refer to the LINKS1000 Installation Manual for more information.

NOTE: Do not wire LINKS Answer zones on keypad zone terminals.

[25] Interior Delay Zone
This zone type is normally used with motion detectors and has a standard exit delay time.

If the panel is Stay armed (a delay zone is NOT violated during the exit delay), the Stay key is used, or [*][9] is used for arming), a violation of the zone will initiate Entry Delay 1.

[27] Push to Set Zone
If any zones are programmed as Push to Set, when the system is armed, the panel will suppress all audible exit delay beeps/squawks and begin an infinite silent exit delay. When a user violates and restores a Push to Set zone, the panel will wait 5 seconds, then terminate the Exit Delay and arm the system.

NOTE: Do not enable Exit Delay Termination if this zone type is used (see 5.18 “Entry/Exit Delay Options” on page 24). Do not change the attributes of Push to Set zones from the default settings.

[28] 24 Hour Bell/Buzzer Zone
This zone type operates the same as [27] Push to Set zone, but can only be used if the smoke detector is wireless.

[87] Delayed 24 Hour Fire (Wireless)
This zone type operates the same as [07] Delayed 24 Hour Fire Zone and must be used if the smoke detector is wireless.

[88] Standard 24 Hour Fire (Wireless)
This zone type operates the same as [08] Standard 24 Hour Fire Zone and must be used if the smoke detector is wireless.

Zone Definitions: .................................................. [001]
Zone Assignments: ............................................. [202]

5.3 Zone Attributes
NOTE: All zones, with the exception of 24 Hour and Fire, will provide an exit delay.

NOTE: Do not change the attributes for Fire Zones from the default settings.

Additional zone attributes can be programmed to customize the operation of a zone for a specific application. The following attributes are programmable for each zone:

- Audible / Silent – This attribute determines whether or not the zone will activate the alarm output.
• **Pulsed / Steady** – This attribute determines whether the alarm output will be steady or will pulse on and off every second.

• **Activate Chime** – This attribute determines whether or not the zone will activate the chime feature (see "[*]"/"[4]
Door Chime On/Off" on page 9).

• **Bypass Enable** – This attribute determines whether or not the zone can be manually bypassed (see "[*]/[1]
Bypassing and Activating Stay/Away Zones" on page 8).

• **Force Arm Enable** – This attribute determines whether or not the system can be armed while a zone is violated. At the end of the exit delay, if this type of zone is violated, it will be ignored by the panel. Once the zone is secured, it will be monitored by the system. This zone attribute, for example, will allow the user to arm the system with the garage door open. Later, when the door is closed, it will be armed along with the rest of the system. Do not program this attribute for 24-hour zones.

• **Swinger Shutdown Enable** – This attribute determines whether or not the panel will shut down the communicator and bell for a zone once its swinger limit has been reached (see section 5.19 “Swinger Shutdown” on page 24).

• **Transmission Delay Enable** – This attribute determines whether or not the panel will delay communicating the alarm reporting code for the programmed Transmission Delay Period (see section 5.15 “Transmission Delay” on page 23).

• **Wireless Zone** – This attribute determines which zones are to have wireless devices. This allows the panel to generate a low battery trouble and zone supervisorys for the wireless zones.

**NOTE:** Any zone with the wireless attribute enabled will not cause an alarm for a fault condition when armed (or any time for 24-hour zones).

---

**5.4 Assigning Keypad Zones**

"Z" keypads have zone inputs to which devices—such as door contacts—can be connected. (See section 2.11 “Keypad Zones” on page 6 for wiring information.) Once the keypad zones are installed, assign the zone in programming section [020] Keypad Zone Assignments.

Enter the 2 digit zone designated for each keypad (address) from 01-08.

---

**5.5 Communicator – Dialing**

If the **Communicator Disable** option is selected, the panel will not attempt to call central station. If communication is enabled, the panel will attempt to call central station when an event with a valid reporting code occurs (See section 5.8 “Communicator – Reporting Codes” on page 17).

The **Communicator Call Direction** options are used to select which telephone number the panel will dial when an event occurs.

If the **DTMF Dialing** option is enabled, the panel will dial using DTMF (touch tone). If the **Switch to Pulse Dial** option is enabled, the panel will switch to pulse dialing on the fifth attempt to call the central station. When this option is disabled, the panel will always dial using DTMF. If **DTMF Dialing** is disabled, the panel will always pulse dial.

When the **Force Dialing** option is enabled, the panel will dial out regardless of the presence of dial tone. Each dialing attempt will follow this pattern:

a) the panel pick up the telephone line and search for dial tone for 5 seconds

b) if no dial tone is found, the panel will hang up and wait for 20 seconds

c) the panel will pick up the telephone line again and search for a dial tone for 5 seconds

d) the panel will then dial regardless of the presence of dial tone

If there is no initial handshake recognized within 40 seconds the panel will then hang up the line.

If the **Force Dialing** option is disabled, each attempt will still follow the above pattern, except that the panel will not dial in step d if no dial tone is detected.

The **Delay Between Dialing Attempts** timer adds a delay before the next call is dialed.

If the **Busy Tone Detection** option is enabled, the panel will hang up after detecting busy tone for 5 seconds and will redial after the amount of time programmed in the **Delay Between Dialing Attempts** section.

**Maximum Dialing Attempts** determines the maximum number of attempts the panel will make to send a signal to the central station before indicating a Failure to Communicate (FTC) trouble condition. The maximum number of dialing attempts that can be programmed is 15.

The **3rd Telephone Number** can be used to back up the 1st in the event of an FTC. (see section 5.7 “Communicator – Telephone Numbers” on page 17). If a later communication attempt is successful, the FTC reporting code(s) programmed in section [351] will be transmitted along with the unreported events from an earlier unsuccessful communication.

When **Bell on FTC when Armed** is enabled in programming section [702], option [8], an FTC during the armed period will sound an Audible Alarm for the length of Bell time-out or until the system is disarmed. If FTC **Trouble Only when Armed** is enabled, only the keypad buzzer will sound trouble beeps every 10 seconds until a key is pressed.

**Post Dial Wait for Handshake** determines the amount of time the panel will wait for a valid handshake from the receiver. If the panel does not hear the handshake it will consider the call a failed attempt; hang up and try again.

The **Pulse Dialing Make/Break Ratio** option can change the Make/Break ratio to 33/67 from the North American ratio of 40/60.

With **ID Tone Enabled** the panel will pulse a tone on the telephone line to indicate that the panel is on the line.

The **2100Hz/1300Hz** option selects the frequency of the ID tone that is pulsed on the line.

**NOTE:** Contact your local telephone company to confirm which settings should be used.

---

5.6 Communicator - Account Numbers

The account number is used by the central station to distinguish between panels. There are two account numbers programmable for the PC585.

- First Account Code (4 digits) . . . . . . . . . . . Section [310]
- Second Account Code (4 digits) . . . . . . . . . . . Section [311]

5.7 Communicator - Telephone Numbers

The panel can use three different telephone numbers for communicating with the central station. The First Telephone Number is the primary number, the Second Telephone Number is the secondary number and the Third Telephone Number will back up the First telephone number if enabled.

NOTE: The Third Telephone Number will NOT back up the Second Telephone Number.

NOTE: If you enter a telephone number section (sections [301] - [303]) at an LED keypad, pressing [#] will delete the programmed telephone number and change all the digits to [F].

The panel will only attempt to call the Second telephone number after failing to communicate with the first telephone number.

NOTE: To use the Third Telephone Number, you must enable it in section [380], option [5], and program it in section [303].

Telephone numbers can be up to 32 digits. This allows you to add special digits if required. To program the telephone number, enter the numbers 0 through 9 as required. The following is a list of programmable HEX digits and the functions they perform:

- HEX (C) - simulates the [#] key on a touch tone telephone
- HEX (D) - forces the panel to search for dial tone
- HEX (E) - forces the panel to pause for 2 seconds
- HEX (F) - marks the end of the telephone number

NOTE: The first digit of all telephone numbers must be the HEX digit ‘D’ for dial tone search, or HEX digit ‘E’ for a two-second pause.

5.8 Communicator – Reporting Codes

The panel can be programmed to report events to the central station by sending the Reporting Code programmed for a particular event.

Reporting codes can be one or two digits and can use HEX digits (A through F). For a complete description of reporting codes which can be programmed and lists of automatic Contact ID and SIA format codes, please see Appendix A.

NOTE: Do not use the digit C in a reporting code when using Pager Format. In most cases, the digit C will be interpreted as a [#] which will terminate the page before it has finished.

Cross Zone Police Reporting Code

The Cross Zone Police Code Alarm will be sent when two different alarms occur during any armed-to-armed period. When an alarm occurs while the panel is armed and a second alarm occurs on a different zone during the same armed period, or after the system is disarmed, this code will be sent. All zone types contribute to this alarm. The cross zone police code will be transmitted immediately unless either or both zones have the Transmission Delay attribute enabled. If so, the code will be delayed for the programmed transmission delay time.

Zone Restorals

If the Restoral on Bell Time-out option is selected, the panel will send the Zone Restoral Reporting Code for the zone if the bell cut-off time has expired and the zone is secured. If the zone is not secured when the bell cut-off time expires, the panel will send the restoral immediately once the zone is secured, or when the system is disarmed. If the Restoral on Bell Time-out option is not selected, the panel will immediately send the Zone Restoral Reporting Code when the zone is secured, regardless of whether or not the alarm output is active.

NOTE: 24 Hour type zones will report the restoral immediately when the zone is secured.

Closings (Arming Codes)

If the Closing Confirmation option is enabled, once the exit delay expires, the keypad will sound a series of eight beeps to confirm to the user that the closing code was sent and received by the central station.

The panel identifies which zones are bypassed on a Partial Closing. To do this, the panel will send the partial closing reporting code, and then the alarm restore reporting code(s) for the zone(s) which are bypassed.

For example, if a panel is armed with Access Code 40 with Zones 3 and 5 bypassed, the panel will transmit:

- Partial Closing
- Alarm Restore Zone 3
- Alarm Restore Zone 5
- Closing By User Code 40

The panel will follow the Alarm Restore Call Direction options programming.

NOTE: This feature does not apply to the SIA format, which uses CG-ZZ to identify zones for Partial Close.

Openings/Closings by Wireless Key

If you are using a PCS132 v3.0 or higher, wireless keys with access codes may be identified when they are used to arm or
communicate using the following specifications:

Depending on which pulse format is selected, the panel will communicate using the following specifications:

- 3/1, 3/2, 4/1 or 4/2
- 1400 or 2300 Hz handshake
- 10 or 20 bits per second
- non-extended

Wireless Maintenance

The panel will transmit a Wireless Device Low Battery Alarm reporting code if a low battery condition is indicated by a detector. Transmission and logging to the event buffer of the trouble will be delayed by the number of days programmed for Zone Low Battery Transmission Delay. The Wireless Device Low Battery Restoral reporting code will be transmitted when the problem is corrected. The specific zone that caused the trouble will be recorded in the event buffer.

NOTE: The restoral will not be transmitted until all detectors indicate good battery conditions.

Wireless Maintenance Reporting Codes . . . . . . . . . Section [353]
Zone Low Battery Transmission Delay . . . . . . . . Section [370]

AC Failure Trouble Alarm Code

To prevent the panel from transmitting an AC Failure Trouble Alarm reporting code during short power outages, the panel will not send the signal unless AC power is lost for the amount of minutes programmed for the AC Failure Communication Delay. The AC Failure Trouble Restoral reporting code follows the AC failure communication delay as well.

NOTE: If AC Failure Communications Delay is programmed as “000,” then the AC failure transmission will be immediate.

AC Failure Communication Delay . . . . . . . . . . . . . . Section [370]

5.9 Communicator – Reporting Formats

Each communication telephone number can be programmed to report using any one of ten formats available. Two 20 BPS pulse formats and two 10 BPS formats are supported, in addition to Contact ID, SIA, Pager, Private Line, Scantronics 4-8-1 and Sur-Gard 4-8-1 formats.

The Communicator Call Directions options can be used to disable the reporting of events such as Openings and Closings.

NOTE: Do not program the 2nd telephone number to use Contact ID or SIA reporting code formats (section [360]) if Automatic reporting codes are selected for either Contact ID or SIA (section [381]).

Communicator Format Options . . . . . . . . . . . . . . . Section [360]
Communicator Call Directions . . . . . . . . . . . . . . . Section [361] to [368]

The following is a description of each reporting format:

Pulse Formats

With the 1600Hz Handshake option enabled, the communicator will respond to 1600Hz handshakes when using the reporting Communication Formats 01 and 02 only. When the Standard Handshake option is enabled, the communicator will respond to the handshake specified by the BPS format (1400Hz or 2300Hz).

Additional Notes on Pulse Formats

1. The digit ‘0’ will send no pulses and is used as a filler digit.
2. When programming account numbers, enter four digits. When programming a three digit account number, the fourth digit must be programmed as ‘0’.
3. If an account number has a ‘0’ in it, substitute a HEX digit ‘A’ for the ‘0’.
4. The reporting codes are two digits. When programming single-digit Reporting Codes, the second digit must be programmed as ‘0’. If a ‘0’ is to be transmitted, substitute HEX digit ‘A’.

AC Failure Trouble Restoral Code

To prevent the panel from transmitting a trouble restoral code, the panel will not attempt to call central station.

NOTE: If the Automatic Contact ID option is selected, the panel will automatically generate all other information, including the zone number.

If the Contact ID uses Programmed Reporting Codes option is enabled, a two digit number from Appendix A must be entered in programming sections [320] to [353] for each event to be transmitted. The two digit number determines the type of alarm. The panel will automatically generate all other information, including the zone number.

NOTE: If the Automatic Contact ID option is selected, the panel will automatically generate all zone and access code numbers, eliminating the need to program these items.

If the Contact ID uses Programmed Reporting Codes option is enabled, the panel will operate as follows:

1. If an event’s reporting code is programmed as [00], the panel will not attempt to call the central station.
2. If the reporting code for an event is programmed as anything from [01] to [FF], the panel will automatically generate the zone or access code number. See Appendix A for a list of the codes which will be transmitted.

NOTE: If the Automatic Contact ID option is selected, the panel will automatically generate all zone and access code numbers, eliminating the need to program these items.

Additional Notes on Contact ID

1. Account numbers must be four digits.
2. All reporting codes must be two digits.
3. Substitute the HEX digit ‘A’ for the ‘0’.

With the 1600Hz Handshake option enabled, the communicator will respond to 1600Hz handshakes when using the reporting Communication Formats 01 and 02 only. When the Standard Handshake option is enabled, the communicator will respond to the handshake specified by the BPS format (1400Hz or 2300Hz).

Additional Notes on Pulse Formats

1. The digit ‘0’ will send no pulses and is used as a filler digit.
2. When programming account numbers, enter four digits. When programming a three digit account number, the fourth digit must be programmed as ‘0’.
3. If an account number has a ‘0’ in it, substitute a HEX digit ‘A’ for the ‘0’.
4. The reporting codes are two digits. When programming single-digit Reporting Codes, the second digit must be programmed as ‘0’. If a ‘0’ is to be transmitted, substitute HEX digit ‘A’.

AC Failure Trouble Restoral Code

To prevent the panel from transmitting a trouble restoral code, the panel will not attempt to call central station.

NOTE: If the Automatic Contact ID option is selected, the panel will automatically generate all other information, including the zone number.

If the Contact ID uses Programmed Reporting Codes option is enabled, a two digit number from Appendix A must be entered in programming sections [320] to [353] for each event to be transmitted. The two digit number determines the type of alarm. The panel will automatically generate all other information, including the zone number.

NOTE: If the Automatic Contact ID option is selected, the panel will automatically generate all zone and access code numbers, eliminating the need to program these items.

If the Contact ID uses Programmed Reporting Codes option is enabled, the panel will operate as follows:

1. If an event’s reporting code is programmed as [00], the panel will not attempt to call the central station.
2. If the reporting code for an event is programmed as anything from [01] to [FF], the panel will automatically generate the zone or access code number. See Appendix A for a list of the codes which will be transmitted.

NOTE: If the Automatic Contact ID option is selected, the panel will automatically generate all zone and access code numbers, eliminating the need to program these items.

Additional Notes on Contact ID

1. Account numbers must be four digits.
2. All reporting codes must be two digits.
3. Substitute the HEX digit ‘A’ for the ‘0’. 
4. To prevent the panel from reporting an event, the reporting code should be programmed as [00].
5. To change the Contact ID Partial Close Identifier from (4) to (5), change the programming in section [018]: [4].

Please refer to Appendix A for a list of Contact ID Identifiers.

SIA
SIA is a specialized format that will communicate information quickly using Frequency Shift Keying (FSK) rather than pulses. The SIA format will automatically generate the type of signal being transmitted, such as Burglary, Fire, Panic etc. The two digit reporting code is used to identify the zone or access code number.

NOTE: If the Automatic SIA option is selected, the panel will automatically generate all zone and access code numbers, eliminating the need to program these items.

If the SIA Sends Automatic Reporting Codes option is enabled, the panel will operate as follows:
1. If an event's reporting code is programmed as [00], the panel will not attempt to call the central station.
2. If the reporting code for an event is programmed as anything from [01] to [FF], the panel will automatically generate the zone or access code number and send the reporting code.

If the SIA Sends Programmed Reporting Codes option is enabled, the panel will operate as follows:
1. If an event's reporting code is programmed as [00] or [FF], the panel will not attempt to call central station.
2. If the reporting code for an event is programmed as anything from [01] to [FE], the panel will send the programmed reporting code.

Please refer to Appendix A for a list of SIA identifiers.

Pager Format
The communication format option for either telephone number can be programmed as Pager format. If an event occurs and the Communicator Call Direction options direct the call to a telephone number with the Pager Format selected, the panel will attempt to page.

When calling a pager, extra digits will be required in order for the format to function properly. The following is a list of Hex digits and the functions they perform:
- Hex [B] - simulates the [*] key on a touch tone telephone
- Hex [C] - simulates the [#] key on a touch tone telephone
- Hex [D] - forces the panel to search for dial tone
- Hex [E] - two second pause
- Hex [F] - marks the end of the telephone number

The panel will attempt to call the pager once. Once the appropriate telephone number is dialed, the panel will send the account number and Reporting Code followed by the [#] key (Hex [C]).

The panel has no way of confirming if the pager was called successfully. A Failure To Communicate trouble will only be generated if the panel detects a busy tone on all dialing attempts, or if no dial tone is detected on all dialing attempts. The pager format will not cause any form of ringback.

NOTE: Do not use the digit C in a reporting code when using Pager Format. In most cases, the digit C will be interpreted as a [#] which will terminate the page before it has finished.

NOTE: If the panel detects a busy signal, it will attempt to page again. It will make the maximum number of attempts programmed in section [160].

NOTE: Force dialing should be disabled when using Pager format.

NOTE: When using Pager format, you must program two hex digit E's at the end of the telephone number.

Private Line Format
The Private Line format allows the communication of events directly to a user over a telephone line. When an event occurs that the panel is programmed to communicate, the panel seizes the line and dials the programmed telephone number(s). The panel then emits a double beep on the line every 3 seconds. This indicates to the user receiving the call that the control panel is calling.

The user must acknowledge the call by pressing 1, 2, 4, 5, 7, 8, 0, * or # from any touchtone telephone. The panel will wait for this acknowledgment for the duration of Post Dial Wait for Handshake timer.

The panel will then indicate which zone is in alarm by sounding a corresponding number of beeps (e.g. three beeps for Zone 3). The user must then press a key (1, 2, 4, 5, 7, 8, 0, * or #) to acknowledge the alarm. If the panel has another alarm to communicate, it will sound a corresponding number of beeps for the new zone alarm. The user must then press a key to acknowledge the signal. When there are no further alarms, the panel will hang up.

NOTE: The keys 3, 6 and 9 are not valid handshakes.

NOTE: Events not received by the central station due to an FTC will not be transmitted via the Private Line format.

Scantronics and Sur-Gard 4-8-1 Formats
These are DTMF formats that send reporting codes as:
- One 4-digit account code
- Eight 1-digit reporting channels (event code)
- One 1-digit status channel

The software automatically generates a code for the event based on the programming of the call direction groups.

NOTE: If your central station uses a Scantronics 5100 receiver, only program numbers from 1 to 6 for the event code.

Example: If you program the zone 3 alarm reporting code as [31], the panel will send event code 1 in channel 3. The panel will send the number 5 for each of the other channels, so that the event code will look like:

5 5 1 5 5 5 5

The panel will send the status code (i) based on the status of the zone.
7 = Alarms, Tampers, Restorals, Openings & Closings
8 = Trouble or Trouble Restoral
9 = Test Transmission.

Example: If there is an alarm on Zone 3 the panel will send: a a a a 5 5 1 5 5 5 5 7
To disable communication for specific events, program ‘00’ or ‘FF’ for the reporting code.
The Scantronics and Sur-Gard 4-8-1 formats work similarly. Select one or the other depending on the type of receiver in use at the central station.

5.10 Downloading

The required downloading software is DLS-1 version 6.6P and up.

Downloading allows you to program the entire control panel via a computer, a modem and a telephone line. All functions, features, their changes and status – such as trouble conditions and open zones – can be viewed or programmed through downloading.

NOTE: Downloading is always enabled for six hours each time the panel is powered up, unless the User Can Enable DLS Window option is disabled.

The panel will answer calls for downloading when the programmed Number of Rings is heard by the panel. If the Answering Machine/Double Call option is enabled (or during the first six hours after power up), the panel will answer incoming calls for downloading in the following manner:
1. The panel hears one or two rings then misses a ring.
2. At this point the panel will start a double-call timer.
3. If the panel hears another ring before the Answering Machine Double-Call Timer expires, it will answer on the first ring of the second call.
The panel will immediately go on line and begin downloading.

If the Call-Back option is enabled, the panel and the computer will both hang up. The panel will then call the Downloading Computer’s Telephone Number and wait for the computer to answer. Once the computer answers, downloading will begin.

If the User Enabled DLS Window option is ON, the user can activate the downloading feature for a set period of time by entering [*][6][Master Code][5].

If the Full 6-hour User Enabled DLS Window option is enabled, when the user opens the DLS window with [*][6][Master code][5], the DLS window will remain open for six hours. The DLS window will remain open after a successful hang-up from a downloading call. If the One Time 1-hour User Enabled DLS Window option is enabled, when the user opens the DLS window with [*][6][Master code][5], the DLS window will stay open for one hour, and will close after a successful hang-up from a downloading call.

After six hours, the panel will not answer incoming calls unless the Answering Machine/Double Call option is enabled, or the Number of Rings is programmed to be more than 0.

If the User Initiated Call-Up option is enabled, the user can have the panel initiate a call to the downloading computer by pressing [*][6][Master Code][6].

The Download Access Code and Panel Identifier Code are for security and proper identification. Both the panel and the computer file should contain the same information programmed before attempting to download.

The time to complete a successful download can be significantly reduced with the use of the PC-LINK. This adaptor makes it possible to perform on-site downloading. To Initiate Local Downloading via the PC-LINK, enter [*][8][Installer’s Code][499][Installer’s Code][499]. All keypads will be busy for the duration of the PC-LINK connection. The status LEDs will display the current system status on the keypad where the PC-LINK was initiated. For more information on connecting the PC-LINK, refer to your “PC-LINK Download Kit Instruction Sheet”.

NOTE: When a zone status upload is performed through PC-LINK, the information uploaded may not be accurate. For more information, refer to your DLS-1 manual.

Downloading can also be performed through the LINKS 1000 cellular communicator if the telephone line is disconnected. If using the LINKS1000 with Call Back, you need to program the LINKS 1000 Preamble with the downloading telephone number in order for the panel to call the computer correctly.

NOTE: When uploading labels from LCD keypads, only labels from the LCD keypad assigned to address 8 will be uploaded.

5.11 PGM Output Options

Programmable outputs PGM1 and PGM2 on the main board can be programmed by selecting one of the output options listed below (exceptions noted).

Main Board PGM Outputs . . . . . . . . . . . . . . . . . . . . . . Section [009]

NOTE: PGM outputs cannot be disabled in installer’s programming. To disable a PGM output, you must remove all wiring from the output.

[01] Burglary and Fire Bell Output
The output will activate when the alarm output is active and will deactivate when the alarm output is silenced. If the alarm output is pulsing, the PGM output will pulse as well. This output will follow the activation of the alarm output (pre-alert) for delayed fire zones.

[02] For future use

[03] Sensor Reset ([*][7][2])
NOTE: This output will normally be active (switched to ground).

This option is used to reset power for latching smoke detectors. The output will deactivate for five seconds when the [*][7][2] command is entered (see “[*][7] Command Output Functions” on page 10). The keypad buzzer will not sound for the fifth second period. After performing a sensor reset, wait 15 seconds before attempting to arm the system.

Please refer to the Control Panel Wiring Diagram in this manual for wiring instructions.

NOTE: Only ONE of options [03] Sensor Reset and [20] Command Output Option #2 may be programmed on the same system.

[04] For future use
[05] Armed Status
When the system is armed, the PGM output will activate at the beginning of the exit delay. The output deactivates when the system is disarmed.

[06] Ready To Arm
The PGM will be active as long as the system is ready to arm and all non-force armable zones on the system are restored. Once an access code is entered to arm the system and the exit delay begins, the PGM output is deactivated.

[07] Keypad Buzzer Follower Mode
The PGM will activate when any of the following events occur and will remain active for as long as the keypad buzzer is active:

- Door Chime
- Auto-Arm Prealert
- 24 Hour Supervisory Buzzer Zone

[08] Courtesy Pulse
Upon arming, the PGM output will activate for the duration of the exit delay plus an additional two minutes. Upon disarming, the PGM output will activate for the duration of the entry delay plus an additional two minutes.

[09] System Trouble Output
The PGM output will activate when any of the selected trouble conditions are present. It will deactivate when all the selected trouble conditions are cleared.

The PGM attributes for this option, programmed in sections [141] to [142], differ from the standard selection of attributes. Program which trouble conditions will activate the output by selecting some or all of the following attributes:

Attribute

1. Service Required (battery, bell, general trouble, general tamper, general supervisory)
2. AC Failure
3. Telephone Line Trouble
4. Failure to Communicate
5. Fire Trouble / Zone Fault
6. Zone Tamper
7. Zone Low Battery
8. Loss of Clock

[10] System Event (Strobe Output)
The output activates when any of the selected system events (alarms) occur on the system.

NOTE: This output will activate for silent and audible alarms or medical conditions only. It will not activate during pre-alert or delays.

If attribute [8] is turned ON, the output will activate for the number of seconds programmed in the PGM output timer (section [164]).

If attribute [8] is turned OFF, in the armed state, the output will deactivate only once the system is disarmed. If an alarm activates this output in the disarmed state, the output will deactivate if a user enters a valid access code while the Bell Cut-off timer is counting down, or if the telephone line is restored. The output will also deactivate if someone arms the system after the Bell Cut-off has expired.

NOTE: This output will activate for all silent and audible alarms except the Duress alarm.

[11] System Tamper (All Sources)
The PGM output will activate when any tamper condition is present and will deactivate when all tampers are restored.

[12] TLM and Alarm
The PGM output activates when the system experiences both a telephone line trouble and an alarm. When the system is armed, the output will deactivate only if an access code is entered or if the telephone line is restored.

If an alarm activates this output in the disarmed state, the output will deactivate if a user enters a valid access code while the Bell Cut-off timer is counting down, or if the telephone line is restored. The output will also deactivate if someone arms the system after the Bell Cut-off has expired.

NOTE: This output will activate for all silent and audible alarms except the Duress alarm.

The output will activate for two seconds after the control panel receives the kissoff transmission from the central station.

[14] Ground Start Pulse
The PGM Output will activate for two seconds to obtain a dial tone on Ground Start telephone equipment before the panel attempts to dial. Insert two 2-second pauses at the beginning of the telephone number when using this option.

This output can be activated and deactivated remotely using the DLS software.

[16] LINKS1000 Support (PGM1 Only)
The PGM output will be used as a data wire to communicate telephone number information for the LINKS1000 cellular unit.

[17] Away Armed Status
When the system is armed in the Away mode, the PGM output will activate at the beginning of the exit delay. The output deactivates when the panel is disarmed.

[18] Stay Armed Status
When the system is armed in the Stay mode, the PGM output will activate at the beginning of the exit delay. The output deactivates when the panel is disarmed.
[20] Command Output Option #2
These outputs are user-initiated by entering [*][7][1-2] at any keypad. When any output is activated, three acknowledgment beeps are sounded.

**NOTES on Option [20]:** Press [*][7][2][Access Code, if required] to activate any output programmed as one of PGM output option [03] or [20]. Traditionally, [*][7][2] has been reserved for resetting smoke detectors. Smoke detectors should now be programmed as output [03] “Sensor Reset”.

**NOTE:** Only ONE of options [03] Sensor Reset and [20]*[7][2]
Command Output Option #2 may be programmed on the same system.

[21]-[24] For future use

[26] Battery Test (PGM1 only)
When the panel performs the 10-second battery check, the Battery Test output will activate. You may use this output type to switch a 20 ohm load across to test the battery for the 10 second battery check period. Connect a resistor between the Bell+ and PGM1 terminals.

**PGM Output Attributes**
In addition to programming the output type, you must also program the PGM output attributes for each output.

PGM output options [09] “System Trouble” and [10] “System Event” have their own unique set of attributes listed below the description of each output type.

PGM output options [01], [03], [05]-[08], [11]-[26] have the following attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>ON</th>
<th>OFF</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1] ....... Output Enabled</td>
<td>Disabled</td>
<td></td>
</tr>
<tr>
<td>[3] ....... True Output</td>
<td>Inverted Output</td>
<td></td>
</tr>
<tr>
<td>Attribute ON: the output energizes when activated</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Attribute OFF: the output de-energizes when activated</td>
<td></td>
<td></td>
</tr>
<tr>
<td>[4] ....... Output Pulsed</td>
<td>Output ON/OFF</td>
<td></td>
</tr>
<tr>
<td>Attribute ON: the output will activate once for the amount of time programmed in section [164] when initiated by the user</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Attribute OFF: the output will toggle ON or OFF when initiated by the user. (Only applicable to options [19]-[20].)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Attribute ON: the output requires a code for activation</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Attribute OFF: no code required. (only applicable to keypad-activated outputs)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

PGM attributes return to their default settings when you change PGM output options. Please see the programming worksheets for a list of the default settings for each PGM output type.

Care should be taken in selecting the normal and active states of each PGM output to ensure that an undesirable output state does not occur after a loss and restore of AC power.

**NOTE:** Attribute [3] must be ON (default) for PGM output option [16].

**NOTE:** If you program more than one PGM output as the same output type (e.g. if PGM1 and PGM2 are both programmed as [19] Command Output 1), the settings for output attributes [1], [2] and [5] must be the same. This does not apply to outputs programmed as types [09] and [10].

**5.12 Telephone Line Monitor (TLM)**
When the TLM Enable option is selected, the panel will supervise the telephone line and will indicate a trouble condition if the telephone line is disconnected.

If the TLM Enable option is ON, the panel will check the telephone line every 10 seconds. If the telephone line voltage is below 3V for the number of checks programmed in the **TLM Trouble Delay** section, the panel will report a TLM trouble. The default number of checks is 3. Enter a number from [003] to [255] in the TLM Trouble Delay section to change the number of checks before the TLM trouble is reported. Programming a delay means that a momentary interruption of the telephone line will not cause a trouble condition.

If the **TLM Trouble Beeps When Armed** option is enabled, the panel will indicate a TLM trouble at the keypad while the system is armed. To activate the bell output in the case of a TLM trouble while the system is armed, the **TLM Audible (Bell) When Armed** option must be selected.

When the trouble condition is restored, the panel can send a TLM Restoral reporting code. Any events which occur while the telephone line is down will also be communicated.

If the LINKS1000 Cellular Communicator, or LINKS2X50 is being used, the panel can be programmed to report a TLM Trouble Reporting Code.

**5.13 Bell**
If you program the **Bell Delay** timer, after a zone triggers an audible burglary alarm, the panel will delay sounding the bell for the programmed amount of time (000-255 minutes). If a user enters an access code during this time period, the panel will not activate the bell.

**NOTE:** The Bell Delay timer will also delay any PGM outputs that follow the main bell.

The bell will silence after the number of minutes programmed for the **Bell Cut-off** time have passed.

The panel supervises the Bell output. If an open condition is detected, the panel will immediately indicate a trouble condition by beeping the keypad twice every 10 seconds to alert the owner of the problem. The panel can send a **Bell Circuit Trouble** and **Trouble Restoral** reporting codes to indicate the situation (see section 5.8 “Communicator – Reporting Codes” on page 17).

If **Fire Bell Continuous** is enabled, the bell will sound until a code is entered. If disabled, the bell will sound until a code is entered or the bell cut-off time has expired.
5.14 Test Transmission

To ensure that the communication link with the central station is functioning properly, program the panel to send a test transmission signal on a regular basis. The panel can send a Periodic Test Transmission Reporting Code at the programmed Test Transmission Time of Day. The Test Transmission Cycle determines the period of time between tests. The option Land Line Test Transmission in Minutes/Days allows you to select whether the Land Line Test Transmission cycle will be counted in minutes or days. If you have selected the test transmission cycle to be in minutes, the Test Transmission Time of Day counter will not apply.

NOTE: If you have selected the Land Line Test Transmission in Minutes option, do not program the test transmission cycle to be less than 10 minutes.

5.15 Transmission Delay

If the transmission delay zone attribute is selected for a given zone, the panel will delay reporting an alarm for that zone for the number of seconds programmed for the Transmission Delay Time. If the panel is disarmed before the delay time expires, the panel will not report the event.

5.16 Fire, Auxiliary and Panic Keys

The emergency keys are available on all keypads. These keys must be pressed and held for two seconds before they will activate. This two second delay is designed to help prevent accidental activation.

If the [F] / Key option is enabled, when the Fire keys are pressed and held for two seconds, the panel will activate the alarm output. The alarm output will sound until a code is entered or until the bell cut-off time expires. Communication of the signal to central station is immediate.

If the [A] / Key is pressed and held for two seconds, the panel will sound the keypad beeps three times to verify activation. The panel will beep the keypad ten times rapidly when a kissoff is received, to verify communication to the central station.

If the [P] / Key is pressed and held for two seconds, the panel will immediately communicate the signal to central station.

If [P] Key Audible Bell and Buzzer option is enabled, when a user presses the [P] / key, the keypad will beep three times and the panel will activate the alarm output until an access code is entered or the bell cut-off expires. If the option is disabled, the Panic alarm will be completely silent.

Each LCD keypad may be programmed to have the [F], [A], & [P] keys enabled or disabled. Please refer to Appendix B: “Programming LCD Keypads” on page 44.

NOTE: The Fire, Auxiliary, Panic keys will operate even if Keypad Blanking is active (See section 5.22 “Keypad Blanking” on page 24).

5.17 Arming/Disarming Options

If the Quick Arm option is enabled, the panel can be armed without an access code by entering [*][0] or by pressing the Stay or Away function key. The Quick Exit option, if enabled, will allow someone to leave an armed premises through a Delay type zone without having to disarm and re-arm the system. See “[*][0] Quick Exit” on page 11.

If the Arm/Disarm Bell Squawk option is enabled, the panel will squawk the alarm output once upon arming and twice upon disarming. If an alarm is in memory, when the panel is disarmed the bell will sound three pairs of disarm squawks. The Opening After Alarm Keypad Ringback option will cause the keypad to beep 8 times rapidly after the Opening After Alarm reporting code has been successfully transmitted to the central station. The Opening After Alarm Bell Ringback option will cause the panel to squawk the bell 8 times rapidly after the Opening After Alarm reporting code has been successfully transmitted to the central station.

NOTE: If the panel is armed using the Stay function key, or by entering [*][9][access code], there will be no bell squawks during entry and exit delays, except for the arm/disarm bell squawks.

Closing Confirmation, if enabled, will cause the keypad to beep 8 times rapidly after the closing reporting code has been successfully transmitted to central station.

If the Bypass Status Displayed While Armed option is chosen, the Bypass light will be ON while the system is armed to indicate that there are bypassed zones.

If the AC/DC Inhibit Arming option is enabled, the panel will not arm if there is an AC or DC (battery) trouble present on the system. Arming will not be allowed until the AC or battery trouble is cleared. If no AC or battery trouble is currently present, when a user attempts to arm the system, the panel will do an automatic battery test of the main panel and modules that support a backup battery. If the battery is good, the system will arm. If the battery is bad, the system will not arm.

If the AC/DC Inhibit Arming option is disabled, the panel will not do an automatic battery test when arming is attempted and the user will not be prevented from arming the system when there is an AC or battery trouble.

If you enable the Unidentified Wireless Key Disarming option, the disarm button will work on wireless keys which have not been assigned access codes. Wireless keys can only be assigned access codes when used with PC5132 v3.0 or higher.
To prevent disarming by wireless keys which don’t have access codes, disable this option. (Please see your PC5132 manual for more information on programming wireless keys.)

**NOTE:** This option must be enabled when using a PC5132 v2.1 or earlier.

---

**5.18 Entry/Exit Delay Options**

Two different Entry Delays can be programmed: the first entry delay will be enabled for Delay 1 type zones and the second for Delay 2 type zones. Only one Exit Delay can be programmed.

**NOTE:** When the panel is armed, the entry delay will follow the entry delay time programmed for the delay zone which is violated first.

Upon arming, the panel will begin the exit delay. If the Audible Entry Delay with Urgency option is enabled, the keypad will beep at one second intervals until the exit delay expires. The keypad will beep rapidly for the last 10 seconds of exit delay to warn the user that the system is about to arm. If this option is disabled, the keypad will not beep during the exit delay.

The Audible Exit Fault, as explained in section 3.1 “Arming and Disarming” on page 8, will notify the user if they failed to secure the premises upon arming. This option can be enabled or disabled according to the user’s needs.

For commercial applications, the Bell Squawk on Exit Delay option may be enabled. The panel will squawk the alarm output once every second when the exit delay is initiated and three times per second for the last 10 seconds until the exit delay expires.

**NOTE:** The bell will not squawk when the panel is Stay or No-entry armed.

Upon entry, if a Delay type zone is violated, the panel will begin the entry delay. The keypad will emit a steady tone. The keypad will pulse the keypad sounder during the last 10 seconds to warn the user the system is about to go into alarm. If there was an alarm during the armed period, the keypad will pulse rapidly for the last 10 seconds of exit delay to warn the user that the system is about to arm. If this option is disabled, the keypad will not beep during the exit delay.

The Bell Squawk on Entry Delay may be enabled. The panel will squawk the alarm output once every second until the entry delay expires or the system is disarmed.

If the Bell Squawk During Auto Arm option is enabled, the bell will squawk once every 10 seconds for one minute during the Auto-arm pre-alert. This will notify anyone on the premises that the system is being armed.

If the Exit Delay Termination option is enabled, the panel will monitor the Delay zones during exit delay. During the exit delay, if a Delay type zone is violated and then secured, the exit delay will be terminated and the panel will be armed immediately.

---

**5.19 Swinger Shutdown**

The swinger shutdown feature is designed to prevent a “runaway” communicator from tying up the central station. After the panel has communicated the programmed number of transmissions for an event, it will no longer report that event until the swinger shutdown is reset. Different swinger shutdown levels can be set for zone alarms, zone tampers and maintenance signals.

By default, each swinger shutdown limit is set to [003]. The panel will not send more than three signals for each zone until the swinger shutdown is reset.

The Bell output will not be activated for alarms on zones that have exceeded the limit of alarms set in the Swinger Shutdown counter.

Swinger shutdown will be reset every day at midnight or when the panel is armed. Once reset, the panel will again communicate normally.

---

**5.20 Event Buffer**

The panel will store the last 128 events which occurred on the system. The event buffer will contain the name, time and date of each event, along with the zone number, access code number or any other information pertaining to the event.

If the Event Buffer Follows Swinger Shutdown option is enabled, the Event Buffer will not store events after the Swinger Shutdown level has been reached. This will prevent the panel from overwriting the entire buffer if a problem exists.

The event buffer can be viewed in three different ways: from an LCD keypad (see “[6] User Functions” on page 10), printed on-site using the PC5400 printer module, or it can be uploaded using DLS software.

---

**5.21 Keypad Lockout Options**

The panel can be programmed to “lock out” keypads if a series of incorrect access codes are entered. Once the Number of Invalid Codes Before Lockout limit has been reached, the panel will lock out all keypads for the lockout duration and log the event to the event buffer. For the duration of the lockout, the panel will sound an error tone when any key is pressed.

**NOTE:** The Invalid Code Counter will be reset every hour.

To disable the keypad lockout option, program the Number of Invalid Codes Before Lockout as [000].

**NOTE:** If Keypad Lockout is active, the panel CANNOT be armed / disarmed with a keyswitch.

---

**5.22 Keypad Blanking**

If the Blank Keypad When Not in Use option is enabled, the panel will turn off all lights and LCDs on the keypads when no
keys are pressed for 30 seconds. The keys, however, will remain backlit. The panel will turn the lights and LCDs back on if entry delay begins or an audible alarm occurs. The lights and LCDs will also come on if a key is pressed or, if a valid access code is entered when the Code Required to Restore Blanking option is enabled.

NOTE: If using a PC5132 v3.0 or greater, and wireless keys, do not enable the Code Required to Restore Blanking option, as the keys will not function correctly.

If the Power Save Mode option is enabled the panel will blank all keypad lights including backlighting when AC power fails, in order to conserve the backup battery.

5.23 Keypad Backlighting
The keys of all the keypads can be backlit to provide easy viewing in dim lighting conditions. If the Keypad Backlighting option is enabled the keys will be illuminated.

5.24 Loop Response
The normal loop response time for all zones is under 400 milliseconds. Zones 1-4 on the control board, however, can be programmed for a fast loop response (under 40 ms).

5.25 Keypad Tamper
If the Keypad Tamper Enable option is selected, the panel will display and transmit a General System Tamper reporting code if any keypad is removed from the wall. When the keypad tamper is restored, the panel will transmit the General System Tamper Restoral reporting code. All keypads should be properly installed and secured before enabling this option.

If the All System Tamper Request Installer Reset option is enabled, any system tamper must be reset by entering "[8][Installer's Code] before the system can be armed. Auto-Arming and Keyswitch arming will also be prevented in the presence of any system tamper.

The Auto Arm Cancellation code is not transmitted when a reset is required because a user has not cancelled the auto arming sequence.

5.26 LINKS 1000 Cellular Communicator
The LINKS 1000 Cellular Communicator can be used three different ways: as the sole communicator for the panel, as a backup for either or both telephone numbers or as a redundant backup to the land line communicator, where the panel will call both the land line and via the LINKS. A LINKS Preamble is programmable for each telephone number in the event that the land line number is local but the LINKS is required to dial an exchange. When programming a LINKS Preamble, all unused digits must be programmed with a hexadecimal “F”. You may need to program a longer delay between dialing attempts to ensure proper operation of the LINKS 1000.

Using LINKS 1000 as the Sole Communicator
The panel can be programmed to report an event only using the LINKS 1000 cellular communicator. To program this option, select only the LINKS 1000 in the Communicator Call Direction options. The Call LINKS as well as Land Line option must also be enabled.

When the selected event occurs the panel will only attempt to call central station using the LINKS.

Using the LINKS 1000 as a Backup Communicator
The panel can be programmed to call using the LINKS 1000 Cellular Communicator if the panel is having difficulty communicating an event using the land line. To program this option, select both the telephone number and LINKS options in the Communicator Call Direction options. The LINKS is Backup of Land Lines option must be selected.

When used as a backup communicator, the panel will attempt to call the central station in the following manner:

1. The panel will try to call using land lines – if unsuccessful, the panel will try to call using the LINKS.
2. If unsuccessful, the panel will try to call using the land lines on the next dialing attempt.

This process will continue until the panel has successfully communicated with the central station or until the panel's programmed number of dialing attempts have been exhausted.

Using the LINKS as a Redundant Communicator
The panel can be programmed to call using first the LINKS1000 and then the land line when an event occurs. To program this option, select both the telephone number and the LINKS options for the Communicator Call Direction options for the event. The Call LINKS as well as Land Line option must be selected.

LINKS Special Preamble
In some areas of North America, dialing #DAT or *DATA reduces the cellular billing increment. The LINKS Special Preamble (section [393]), allows the use of [*] and [#] characters for the programming of #DAT and *DATA.

The LINKS Special Preamble is sent BEFORE the Preamble programmed in Sections [390] to [392]. Example: [Special Preamble][Regular Preamble][Telephone Number]

NOTE: If this Special Preamble is programmed, it will be inserted before the Regular Preamble of ALL telephone numbers. Hex digits D and E are not supported for Preamble programming.

NOTE: If Busy Tone Detection is enabled, the LINKS1000 must be tested to ensure full operation.

Please refer to the LINKS1000 installation Manual for more information and connection diagrams.
5.27 Additional System Modules
The following modules are programmed through the Module Programming sections [801]-[804]: the PC5400 Printer module, the Links2X50 Long-Range Radio interface and the PC5132 Wireless Receiver and all of its devices. For instructions on the installation and programming of these additional modules and devices, please see their respective installation and programming manuals.

PC5400 Programming . . . . . . . . . . . . . . . . . . . . . Section [801]
LINKS2X50 Programming . . . . . . . . . . . . . . . . . . Section [803]
PC5132 Programming . . . . . . . . . . . . . . . . . . . . . Section [804]

5.28 Engineer's Reset
If the Engineer's Reset option is enabled, if the panel has gone into alarm during the previous armed period, or if a 24 Hour zone has gone into alarm, the system will not be ready to arm (Ready Light OFF) until:
- Installer's Programming is entered
- Engineer's Reset is performed via Downloading software.

NOTE: This feature applies to Tamper and Faults in both armed and disarmed states. This does not apply to Module Tamper, System Supervisory, Zone Expander or PGM2 alarms.

Engineer's Reset . . . . . . . . . . . . . . . . . . . . . . Section [018]: [2]

5.29 Clock Adjust
In order to compensate for timing inaccuracies, the panel may be programmed to add or subtract seconds during the last minute of each day using the Clock Adjust programming section. Valid entries are 01 - 99. The default setting is 60 seconds. To determine the value to be programmed in this section, monitor the amount of time lost or gained by the panel over a period of time. Then, calculate the average amount of time per day that the panel gains or loses. If the clock’s timing is off, it may be corrected with this setting.

**Example #1:** The clock loses an average of 9 seconds per day. **Solution:** Program the panel to adjust the clock by 51 seconds (instead of the default 60 seconds) for the last minute of each day in section [700]. This will speed up the panel’s clock by 9 seconds, correcting the problem.

**Example #2:** The clock gains an average of 11 seconds per day. **Solution:** Program the panel to adjust the clock by 71 seconds (instead of the default 60 seconds) for the last minute of each day in section [700]. This will slow down the panel’s clock by 11 seconds, correcting the problem.

**NOTE:** If the auto-arm time is set for 23:59, any change to the Clock Adjust option will directly affect the auto-arm pre-alert time.

Clock Adjust . . . . . . . . . . . . . . . . . . . . . . . . Section [700]

5.30 Timebase
In cases of unstable AC power input you can use the internal crystal to keep a more accurate timebase by enabling the Timebase is Internal Crystal option.

If the 50 or 60Hz AC power input is very stable it can be used as the timebase, by enabling the Timebase is AC line option.

Timebase Internal Crystal/AC line . . . . . . . . . . . . . . . . . . Section [701]: [2]

5.31 Resetting Factory Defaults
On occasion, it may be necessary to default the main control panel or one of the connected modules: the LINKS2X50 Radio interface, the PC5132 wireless receiver, the PC5400 Printer module.

To default the main control panel (hardware), perform the following:
1. Remove AC and battery from the panel.
2. Remove all wires from the Zone 1 and PGM1 terminals.
3. With a piece of wire short the Zone 1 terminal to the PGM1 terminal.
4. Apply AC power to the main panel.
5. When Zone Light 1 is lit on the keypad the default is complete.
6. Remove AC power from the control
7. Reconnect all original wiring and power up the control.

**NOTE:** AC power must be used to power the panel. The panel will not default if only the battery is used.

To default the main control panel software and other modules, perform the following:
1. Enter the Installer's Programming mode.
2. Enter the appropriate programming section [XXX].
3. Enter the Installer's Code.
4. Re-enter the appropriate programming section [XXX].

Example of the panel will take a few seconds to perform the default. When the keypad is again operational the default is complete.

**NOTE:** If using Identified Wireless Keys (PC5132 v3.0 or later only), when the main panel is defaulted, all wireless key access codes must be re-programmed. Refer to your PC5132 v3.0 Installation Manual for more information.

**Restore PC5132 to Default Programming . . . . . . Section [996]**
**Restore PC5400 to Default Programming . . . . . . Section [997]**
**Restore Panel to Default Programming . . . . . . . . Section [999]**

5.32 Installer's Lockout
If Installer's Lockout is selected, a hardware default cannot be performed. If a software default is performed, all programming will restore to factory default.

If Installer’s Lockout Disable is selected, the panel will restore all programming to factory defaults when a hardware or software default is performed on the main control panel.

To enable or disable Installer's Lockout, perform the following:
1. Enter the Installer's Programming mode.
2. Enter the appropriate programming section: [990] or [991].
3. Enter the Installer's Code.
4. Re-enter the appropriate programming section: [990] or [991].

**Installer Lockout Enable . . . . . . . . . . . . . . . . . . Section [990]**
**Installer Lockout Disable . . . . . . . . . . . . . . . . . . Section [991]**

5.33 Walk Test (Installer)
The Installer Walk Test can be used to test the alarm state of each zone of the panel. The walk test cannot be used to test zone type [24].

Before beginning the walk test, ensure the following conditions are met:
1. The panel is disarmed
2. The Keypad Blanking option is disabled (section [016]: [3])
3. The Fire Bell is Continuous option is disabled (section [014]: [8])
4. The Transmission Delay is disabled, if Transmission Delay is not required (section [370])

**NOTE:** Fire Troubles are not supported in Walk Test.

**To perform a Walk Test:**
Step 1 - Enter Installer Programming  
Step 2 - Enter Section [901]
When any zone is violated the panel will activate the Bell Output for two seconds, log the event to the event buffer and communicate the alarm to central station. Each zone should be tested several times during the test. Check the event buffer to ensure that all zones and FAP keys are functioning properly.

**To stop the test:**
Step 1 - Enter Installer Programming  
Step 2 - Enter Section [901]
Check the event buffer after the Walk Test is complete, to ensure that the Audible/Silent 24-hr PGM alarms have been restored.

**NOTE:** The Alarm Memory is cleared upon entering Walk Test mode. When the Walk Test is complete, the Alarm Memory light will remain lit, but there will be no alarms in memory. The light will turn off the next time the panel is armed.

---

Installer Walk Test Enable/Disable . . . . . . . . . . . . . . . . . . Section [901]

Appendix A: Reporting Codes

The following tables contain Contact ID and Automatic SIA format reporting codes. For more information on reporting code formats and notes about individual reporting codes, see sections 5.8 “Communicator – Reporting Codes” on page 17 and 5.9 “Communicator – Reporting Formats” on page 18.

Contact ID
The first digit (in parentheses) will automatically be sent by the control. The second two digits are programmed to indicate specific information about the signal. For example, if zone 1 is an entry/exit point, you could program the event code as [34]. The central station would receive the following:

*BURG - ENTRY/EXIT - 1

where the “1” indicates which zone went into alarm.

Appendix B: Programming LCD Keypads

If you have an LCD5500Z Keypad, additional programming is required for proper operation. The following is a description of the available programming options and their accompanying programming sections:

**How to Enter LCD Programming**

Follow the programming procedure as outlined in Section 4 by pressing [*][8][Installer’s Code]. Press the [*] key. Enter the two digit Section number to be programmed.

**Programmable Labels – Sections [01] - [08], [33], [34], [40], [44], [51], [52]**

Zone labels and other LCD display identifiers can be customized to make operation of the system easier for the end user. The following procedure should be used for creating all LCD labels:

- Enter Installer’s Programming. Enter the Number corresponding to the label to be programmed.
- Use the arrow keys (<>) to move the underline bar underneath the letter to be changed.
- Press the number key [1] to [9] corresponding to the letter you require. The first time you press the number the first letter will appear. Pressing the number key again will display the next letter. Refer to the following chart:

  - [1] - A, B, C, 1
  - [2] - D, E, F, 2
  - [6] - P, Q, R, 6
  - [8] - V, W, X, 8
  - [9] - Y, Z, 9, 0
  - [0] - Space

- When the required letter or number is displayed use the arrow keys (<>) to scroll to the next letter.
- When you are finished programming the label, press the [*] key, scroll to “Save,” then press [*].
- Continue from Step 2 until all labels are programmed.

[98] Initiate Global Label Broadcast

All LCD programming is done per keypad. If more than one LCD keypad are present on the system, and the PC5400 receives labels, labels programmed at one keypad can be broadcast to all other LCD keypads. Perform the following procedure in order to broadcast labels:
Step 1 - Program one LCD keypad completely.
Step 2 - Make sure all LCD keypads are connected to the Keybus.
Step 3 - Enter Installer's Programming, then enter Section [98] at the keypad that was programmed. The keypad will now broadcast all the information programmed to all the other LCD keypads on the system.
Step 4 - When the keypad is finished press the [#] key to exit.

[99] Reset LCD EEPROM to Factory Defaults

FCC COMPLIANCE STATEMENT

CAUTION: Changes or modifications not expressly approved by Digital Security Controls Ltd. could void your authority to use this equipment.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Re-orient the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/television technician for help.

The user may find the following booklet prepared by the FCC useful: “How to Identify and Resolve Radio/Television Interference Problems.” This booklet is available from the U.S. Government Printing Office, Washington D.C. 20402, Stock # 004-000-00345-4.

IMPORTANT INFORMATION

THIS EQUIPMENT COMPLIES WITH PART 68 OF THE FCC RULES. ON THE SIDE OF THIS EQUIPMENT IS A LABEL THAT CONTAINS, AMONG OTHER INFORMATION, THE FCC REGISTRATION NUMBER OF THIS EQUIPMENT.

FROM TELEPHONE COMPANY The customer shall notify the telephone company of the particular line to which the connection will be made, and provide the FCC registration number and the ringer equivalence of the protective circuit.

FCC Registration Number: FS3CAN-32394-AL-E
Ringer Equivalence Number: 0.0B
USOC Jack: RJ31X

TELEPHONE CONNECTION REQUIREMENTS Except for the telephone company provided ringers, all connections to the telephone network shall be made through standard plugs and telephone company provided jacks, or equivalent, in such a manner as to allow for easy, immediate disconnection of the terminal equipment. Standard jacks shall be so arranged that, if the plug connected thereto is withdrawn, no interference to the operation of the equipment at the customer’s premises which remains connected to the telephone network shall occur by reason of such withdrawal.

INCIDENCE OF HARM Should terminal equipment or protective circuitry cause harm to the telephone network, the telephone company shall, where practicable, notify the customer that temporary disconnection of service may be required; however, where prior notice is not practicable, the telephone company may temporarily discontinue service if such action is deemed reasonable in the circumstances. In the case of such temporary discontinuance, the telephone company shall promptly notify the customer and will be given the opportunity to correct the situation.

ADDITIONAL TELEPHONE COMPANY INFORMATION The security control panel must be properly connected to the telephone line with a USOC RJ-31X telephone jack.

The FCC prohibits customer-provided terminal equipment be connected to party lines or to be used in conjunction with coin telephone service. Interconnect rules may vary from state to state.

CHANGES IN TELEPHONE COMPANY EQUIPMENT OR FACILITIES The telephone company may make changes in its communications facilities, equipment, operations or procedures, where such actions are reasonably required and proper in its business. Should any such changes render the customer’s terminal equipment incompatible with the telephone company facilities the customer shall be given adequate notice to the effect modifications to maintain uninterrupted service.

RINGER EQUIVALENCE NUMBER (REN) The REN is useful to determine the quantity of devices that you may connect to your telephone line and still have all of those devices ring when your telephone number is called. In most, but not all areas, the sum of the RENs of all devices connected to one line should not exceed five (5.0). To be certain of the number of devices that you may connect to your line, you may want to contact your local telephone company.

EQUIPMENT MAINTENANCE FACILITY If you experience trouble with this telephone equipment, please contact the facility indicated below for information on obtaining service or repairs. The telephone company may ask that you disconnect this equipment from the network until the problem has been corrected or until you are sure that the equipment is not malfunctioning.

Digital Security Controls Ltd. 160 Washburn St., Lockport, NY 14094

DSG erklärt hervor, dass es den Komponenten überall die vorgeschriebenen Bestimmungen der EU-Richtlinie 1999/5/EG entsprechen.

Per questo mezzo, a DSC, si dichiara che questo apparecchio è conforme ai requisiti essenziali e alle altre determinazioni pertinenti di Direttiva 1999/5/CE.

Con la presente, la Digital Security Controls Ltd dichiara che questo prodotto è conforme ai requisiti essenziali ed altre disposizioni relevanti relative alla Direttiva 1999/5/CE.

Por esta presente, DSC declara que este equipo cumple con los requisitos requeridos por la Directiva 1999/5/CE.

Hiermit verifiziert DSC die Übereinstimmung mit den Anforderungen der Richtlinie 1999/5/EG.

Par la présente, DSC déclare que cet appareil est conforme aux exigences essentielles et autres dispositions pertinentes de la directive 1999/5/CE.

DSC verklart, dat dit apparaat in overeenstemming is met de eisen en bepalingen van richtlijn 1999/5/EG.

Par la présente, DSC déclare que cet article est conforme aux exigences essentielles et autres relevantes provisions de l'directive 1999/5/EG.

Hereby, DSC, declares that this device is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EG.

The complete R & TTE Declaration of Conformity can be found at www.dsc.com/intl/modified.htm.

### Changes for PC585 v2.1DJRU

The PC585 v2.1DJRU software incorporates several new features and changes. The most important additions are listed below:

**Communicator Formats and Features**
- New Scantronics Fast Slot and Sur-Gard 4-8-1 formats
- New Private Line format replaces the Residential format.
  (See 5.9 “Communicator – Reporting Formats” on page 18.)
- Contact I.D. Partial Close Identifier option (See 5.9 “Communicator – Reporting Formats” on page 18.)

**New PGM Output Type**
- [26] Battery Test (See 5.11 “PGM Output Options” on page 20.)

**New Zone Types**
- [27] Push to Set
- [28] 24-Hr Bell/Buzzer
  (See 5.2 “Zone Programming” on page 14.)

**New Options**
- Troubles are Latching (See “[2] Trouble Display” on page 9.)
- Engineer’s Reset Enabled (See 5.28 “Engineer’s Reset” on page 26.)
- Automatic Battery Check (See 2.2 “Terminal Descriptions” on page 3.)
- Bell delay timer (See 5.13 “Bell” on page 22.)

**New Downloading Software**

Downloading software DLS-1 v6.6P must be used. Do not attempt to perform downloading/uploading functions with other software versions.

**Default Changes**
- Sections [006], [403] & [404], Installer’s, Downloading Access, and Panel I.D. codes: 0585
- Section [009], PGM 1-2 defaults: (10) and (19) respectively
- Section [701], AC Line Frequency: 50Hz
- Section [160], Maximum Number of Dialing Attempts - valid entries (000-015)
