Read this instruction sheet thoroughly before installation and use of the FSA-410 4-Wire Smoke Detector. This instruction sheet is intended to be used with the Installation Manual of the alarm control panel. All the instructions specified within that manual must be observed.

Introduction

The FSA-410 is a 4-wire photoelectric smoke detector with the following available options: fixed temperature and rate of rise heat detector, internal piezoelectric alarm, auxiliary form C relay, and/or remote LED output. Three versions are available: US version (UL), Canadian version (ULC) and an International version (EU).

**NOTE:** Heat detection based on rate of rise has not been investigated by UL/ULC.

Operation

Approximately every 7 to 8 seconds the unit tests for a smoke or heat alarm condition. During this sequence the unit also performs self diagnostics, and checks for faults. During normal operation the LED will flash every 50 seconds and the siren will not sound.

Smoke Alarm

The smoke detector has a nominal fixed alarm sensitivity (refer to the Specifications on the last page) and it will go into alarm when the signal level exceeds the ‘alarm’ threshold and activates the alarm relay to send the alarm signal to the control panel. During an alarm the LED will flash once per second and the siren will sound the evacuation temporal pattern.

Remote Alarm - Interconnection

Multiple detectors (with sirens) can be connected using the PRM-4W Polarity Reversal Module. When a fire alarm occurs, the panel will signal the PRM-4W to reverse the polarity of the 4-wire loop. This will activate the sirens of all units connected on the loop. Refer to the PRM-2W/4W Installation Instructions for installation details.

Smoke - Drift Compensation

The detector automatically compensates for long-term environmentally induced changes to maintain a constant smoke sensitivity. When the drift compensation has reached its high or low limit of adjustment, the detector will go into the trouble state.

Heat Alarm

The heat detector will go into alarm when the heat signal level exceeds the heat alarm threshold (135°F/57°C); and send the alarm signal to the control panel. The detector will also go into heat alarm if there is a rapid increase in the temperature over a short period of time. During an alarm the LED will flash once per second and the siren will sound the evacuation temporal pattern.

Installer Instructions

1. Smoke Detector Placement

On smooth ceilings, detectors may be spaced 9.1M (30 feet) apart as a guide. Other spacing may be required depending on ceiling height, air movement, the presence of joists, uninsulated ceilings, etc. Consult National Fire Alarm Code NFPA 72, Chapter 11 or other appropriate national standards for installation recommendations. Do NOT locate smoke detectors at the top of peaked or gabled ceilings; the dead air space in these locations may prevent the unit from detecting smoke. Avoid areas with turbulent air flow, (near doors, fans or windows). Rapid air movement around the detector may prevent smoke from entering the unit. Do NOT locate detectors in areas of high humidity. Do NOT locate detectors in areas where the temperature rises above 38°C (100°F) or falls below 5°C (41°F).
Install smoke detectors in accordance with NFPA 72, Chapter 11: “Smoke detectors shall be installed outside of each sleeping area in the immediate vicinity of the bedrooms and on each additional story of the family living unit, including basements and excluding crawl spaces and unfinished attics. In new construction, a smoke detector shall also be installed in each sleeping room.”

2. Mount Smoke Detector Backplate
Mount backplate using screws provided and the appropriate holes on the mounting plate.

**NOTE:** Install wiring in accordance with the appropriate national and local electrical codes. For UL/ULC Installations, the power supply must be supplied from a UL/ULC Listed alarm control unit.

**CAUTION:** The dust cover protects the unit when not in service. Remove dust cover before use.

3. Wiring
Refer to the wiring diagrams in this installation sheet and those provided in the Installation Manual of the alarm control panel being used with the unit. Before connecting the unit, prepare the wires from the electrical box for connection; Do not use frayed or bent wire.

**NOTE:** Do NOT use looped wire under terminals for system supervision. Break the wire run, to provide supervision of connections.

When wiring is completed, inspect it and correct any errors before applying power to the unit. When the wiring has been thoroughly reviewed, neatly insert the wires into the electrical box and secure the unit to the mounting plate.

To connect this device use only wiring listed as fit for the purpose.

4. Mounting Detector Installation
Position the detector on to the base plate using the detector and base plate alignment marks. Press the detector gently in place while rotating the detector clockwise until the detector snaps into place. Remove the side tab from the locking tab to lock in place (optional).

**Removal:** If the side tab is removed to lock the detector, depress tab with a small flat blade screwdriver and rotate detector counter-clockwise until the alignment marks line up. Remove detector.

5. Test Unit
Initiate test for units without a siren by placing a magnet near the LED/Test Button for greater than 5 seconds. Initiate test for units with a siren by pressing the test button for greater than 5 seconds.

Alarm activation is indicated by the LED, the siren, and the alarm reporting to the control panel. If the smoke detectors are inter-connected using model PRM-4W and a detector is tested, then all detectors will sound. The detector restores to normal when the test button is released or when the magnet is removed.

**NOTE:** Allow a minimum of 20 seconds between test activations.

**NOTE:** If the detector is in one of the following states when a test is initiated; it will not enter an alarm state.

1. Compensation trouble.
2. Failure of heat or smoke detector.
3. Other internal faults that could prevent a smoke or heat alarm.

**NOTE:** Smoke sensitivity of installed detectors can be measured without removal or an alarm being generated using the FSD-100 Smoke Detector Test Meter.

**Test Unit with FSD-100 Smoke Detector Test Meter**
To test the unit using the FSD-100, set the test meter up to read devices as per the instructions supplied with the test instrument. Depress the test button (or place the FSD-100 on the outside edge of the plastics beside the test button to activate the reed switch on units without siren) on the smoke detector for 1 second and release.

**NOTE:** If the test button is held for 5 seconds or longer, an alarm will be generated. Move the test meter over the center of the detector, wait until you hear the test meter beep, remove the unit and the information can be immediately reviewed. Please see the instructions supplied with the FSD-100 Smoke Detector Test Meter for more information.

6. Compensation Reset
Cleaning, replacement of the smoke sensor, or other changes may change the background signal/noise of the detector; this requires the drift compensation be reset. Compensation trouble is one of the faults indicated when the LED indicator is OFF while the siren is chirping.

- Remove power from the unit, then press and hold the test button for 30 seconds to power down unit.
- Power up unit while pressing the test button. The LED will flash; when 5 seconds has elapsed. Release the test button within 1 second after the fifth LED flash.
- The LED will flash every 8 seconds for 1 minute. When the detector stops flashing test the detector to verify normal operation.
Owner’s Instructions

Fire Safety In The Home
Most fires occur in the home, and to minimize this danger, it is recommended that a household fire safety audit be conducted and a family escape plan be developed.

Household Fire Safety Audit
1. Are all electrical appliances and outlets in safe condition? Check for frayed cords, overloaded lighting circuits, etc. If you are uncertain about the condition of your electrical appliances or household service, have a professional evaluation.
2. Are all flammable liquids safely stored in closed containers, and in a cool and well-ventilated area? Avoid cleaning the unit with flammable liquids.
3. Are hazardous materials such as matches out of the reach of children?
4. Are furnaces and wood burning appliances properly installed, clean, and in good working order? If in doubt, have a professional evaluation.

Family Escape Planning
There is often very little time between the detection of a fire and the time it becomes deadly. Because of this, it is very important that a family escape plan be developed and rehearsed.

- Include every family member when developing the escape plan.
- Study the possible escape routes from each location within the house. Since many fires occur at night, give special attention to the escape routes from sleeping quarters.
- It is essential that escape from a bedroom be possible without opening the interior door. Consider the following when making your escape plans:
  - Ensure that doors and windows that open to the outside are easily opened. Ensure that they are not painted shut and that the locking mechanisms operate smoothly.
  - Develop plans for rescue, if opening the exit or using the exit is too difficult for children, the elderly or handicapped. This plan includes making sure that those who are to perform the rescue can promptly hear the fire warning signal.
  - If the exit is above the ground level, provide an approved fire ladder or rope, as well as training in its use.
  - Keep exits on the ground level clear. Be sure to remove snow from exterior patio doors in the winter and that outdoor furniture or equipment does not block exits.
  - Have a predetermined assembly point where everyone can be accounted for; for example, across the street or at a neighbor’s house.
  - Once everyone is out of the house, call the Fire Department.
  - A good plan emphasizes a quick escape. Do not investigate first or attempt to fight the fire, and do not attempt to rescue belongings or valuables as this takes up time. Once outside, do not re-enter the house; wait for the Fire Department.
  - Write the plan down and rehearse it frequently so that should an emergency ever arise, everyone will know what to do. Revise the plan as conditions change; for example, when there are more or fewer family members in the home or if there are changes to the house.

- Make sure your fire warning system is operational by conducting weekly tests. If you are unsure about system operation, contact your smoke detector installer or dealer.
- DSC recommends that you contact your local Fire Department and request further information on home fire safety and escape planning. If available, have your local fire prevention officer conduct an in-house fire safety inspection.

Testing Your Smoke Detector
Follow the test procedure described here or contact your smoke detector dealer or installer for testing instructions. DSC recommends that you test the entire alarm system at least once a week to verify the operation of all system functions.

Units with Siren - Push-button switch
To test the smoke detector, press and hold the test button on the front of the unit for a minimum of 5 seconds, the siren initiates a clicking noise during this time. When the button is pressed, the unit’s alarm will sound and an alarm will be sent to the control panel. When the button is released, the alarm will cease.

Units without Siren - Magnet-activated switch
To test the smoke detector, place a magnet adjacent to the test button on the front of the unit (see Fig. 1) and hold in place for 5 seconds (minimum). When the magnet is in place, the internal reed switch will activate and an alarm will be sent to the control panel. When the magnet is removed, the alarm will cease.

Upon completing the functional testing of the smoke detector, check the unit’s sensing chamber to ensure proper operation. To test the sensing chamber, wave a lit cotton wick or punk stick around the outside of the unit until a generous amount of smoke enters the sensing chamber or the unit alarms. If the smoke detector does not function properly, call your smoke detector installer or dealer for service.

Maintenance
The smoke detector is designed to require minimum maintenance. If the case becomes dusty, vacuum with a small brush attachment. If the case is greasy, wipe the case gently with a soft cloth slightly dampened with soapy water.

Never disassemble the smoke detector; there are no user serviceable parts inside the unit. Never paint the unit. Paint may prevent smoke from entering the unit. If you are planning renovations or repainting, contact your installer and ask that the unit be temporarily removed until work is complete.

If the unit is located in an area where it is exposed to high levels of dust or insects and causes false alarms, it may require service; contact your smoke detector installer or dealer.

Smoke Detector Family

4-Wire Smoke Detector Family

### Operating Voltage Range

- 10-30 VDC
- 20μA@12 or 24VDC
- Maximum Alarm Current: 25mA-90mA
- Smoke Sensitivity UL: 2% ± 0.5%/ft obscuration
- Smoke Sensitivity UL: 3% ± 0.8%/ft obscuration
- Heat Alarm: 135°F (57°C)
- Siren Alarm Pattern UL: Continuous Beeps
- Siren Alarm Pattern UL: Evacuation Temporal Pattern
- Maximum Remote LED output (if equipped): 25mA
- Auxiliary Relay Rating (Form C Relay): 2A @ 30VDC (Resistive)
- Alarm Relay Rating (Form A Relay): 2A @ 30VDC (Resistive)
